HP 5314A

OPERATING AND SERVICE MANUAL

5314A
UNIVERSAL COUNTER

HEWLETT PACKARD

HP 5314A

SAFETY

This power supply is designed and tested according to International Safety Requirements. To ensure safe operation and to keep the product safe, the information, caution, and warnings in this manual must be heeded. Refer to Service Information for general safety considerations applicable to this product.

CERTIFICATION

Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Bureau of Standards, to the extent allowed by the Bureau's calibration facility, and to the calibration facilities of other International Standards Organization members.

WARRANTY

This Hewlett-Packard product has a warranty against defects in material and workmanship for a period of one year from date of shipment, except that in the case of certain components listed in Section I of this manual, the warranty shall be for the specified period. During the warranty period, Hewlett-Packard Company will, at its option, either repair or replace products which prove to be defective.

For warranty service or repair, this product must be returned to a service facility designated by HP. However, warranty service for products installed by HP and certain other products designated by HP will be performed at Buyer's facility at no charge within the HP service travel area. Outside HP service travel areas, warranty service will be performed at Buyer's facility only upon HP's prior agreement or Buyer shall pay HP's round trip travel expenses.

For products returned to HP for warranty service, Buyer shall prepay shipping charges to HP and HP shall pay shipping charges to return the product to Buyer. However, Buyer shall pay all shipping charges, duties, and taxes for products returned to HP from another country.

LIMITATION OF WARRANTY

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

EXCLUSIVE REMEDIES

THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.

ASSISTANCE

Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office. Addresses are provided at the back of this manual.

TABLE OF CONTENTS

TABLE OF CONTENTS (Continued)

SAFETY CONSIDERATIONS

GENERAL

This is a Safety Class I instrument. This instrument has been designed and tested according to IEC Publication 348, "Safety Requirements for Electronic Measuring Apparatus."

Acoustic Noise Emission: LpA <70 dB; not an installed.
GERÄUSCHEMISSION: LpA <70dB; kein Ventilator eingebaut.

OPERATION

BEFORE APPLYING POWER verify that the power transformer primary is matched to the available line voltage and that the correct fuse is installed (See Section II). Make sure that only fuses with required rated current and of the specified type (normal blow, time delay, etc.) are used for replacement. The use of repaired fuses and the short circuiting of fuseholders must be avoided.

SERVICE

Although this instrument has been designed in accordance with international safety standards, this manual contains information, cautions, and warnings which must be followed to ensure safe operation and to retain the instrument in safe condition. Service and adjustments should be performed only by qualified service personnel.

Any adjustment, maintenance, and repair of the opened instrument under voltage should be avoided as much as possible and, when inevitable, should be carried out only by a skilled person who is aware of the hazard involved.

Capacitors inside the instrument may still be charged even if the instrument has been disconnected from its source of supply.

Whenever it is likely that the protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation.

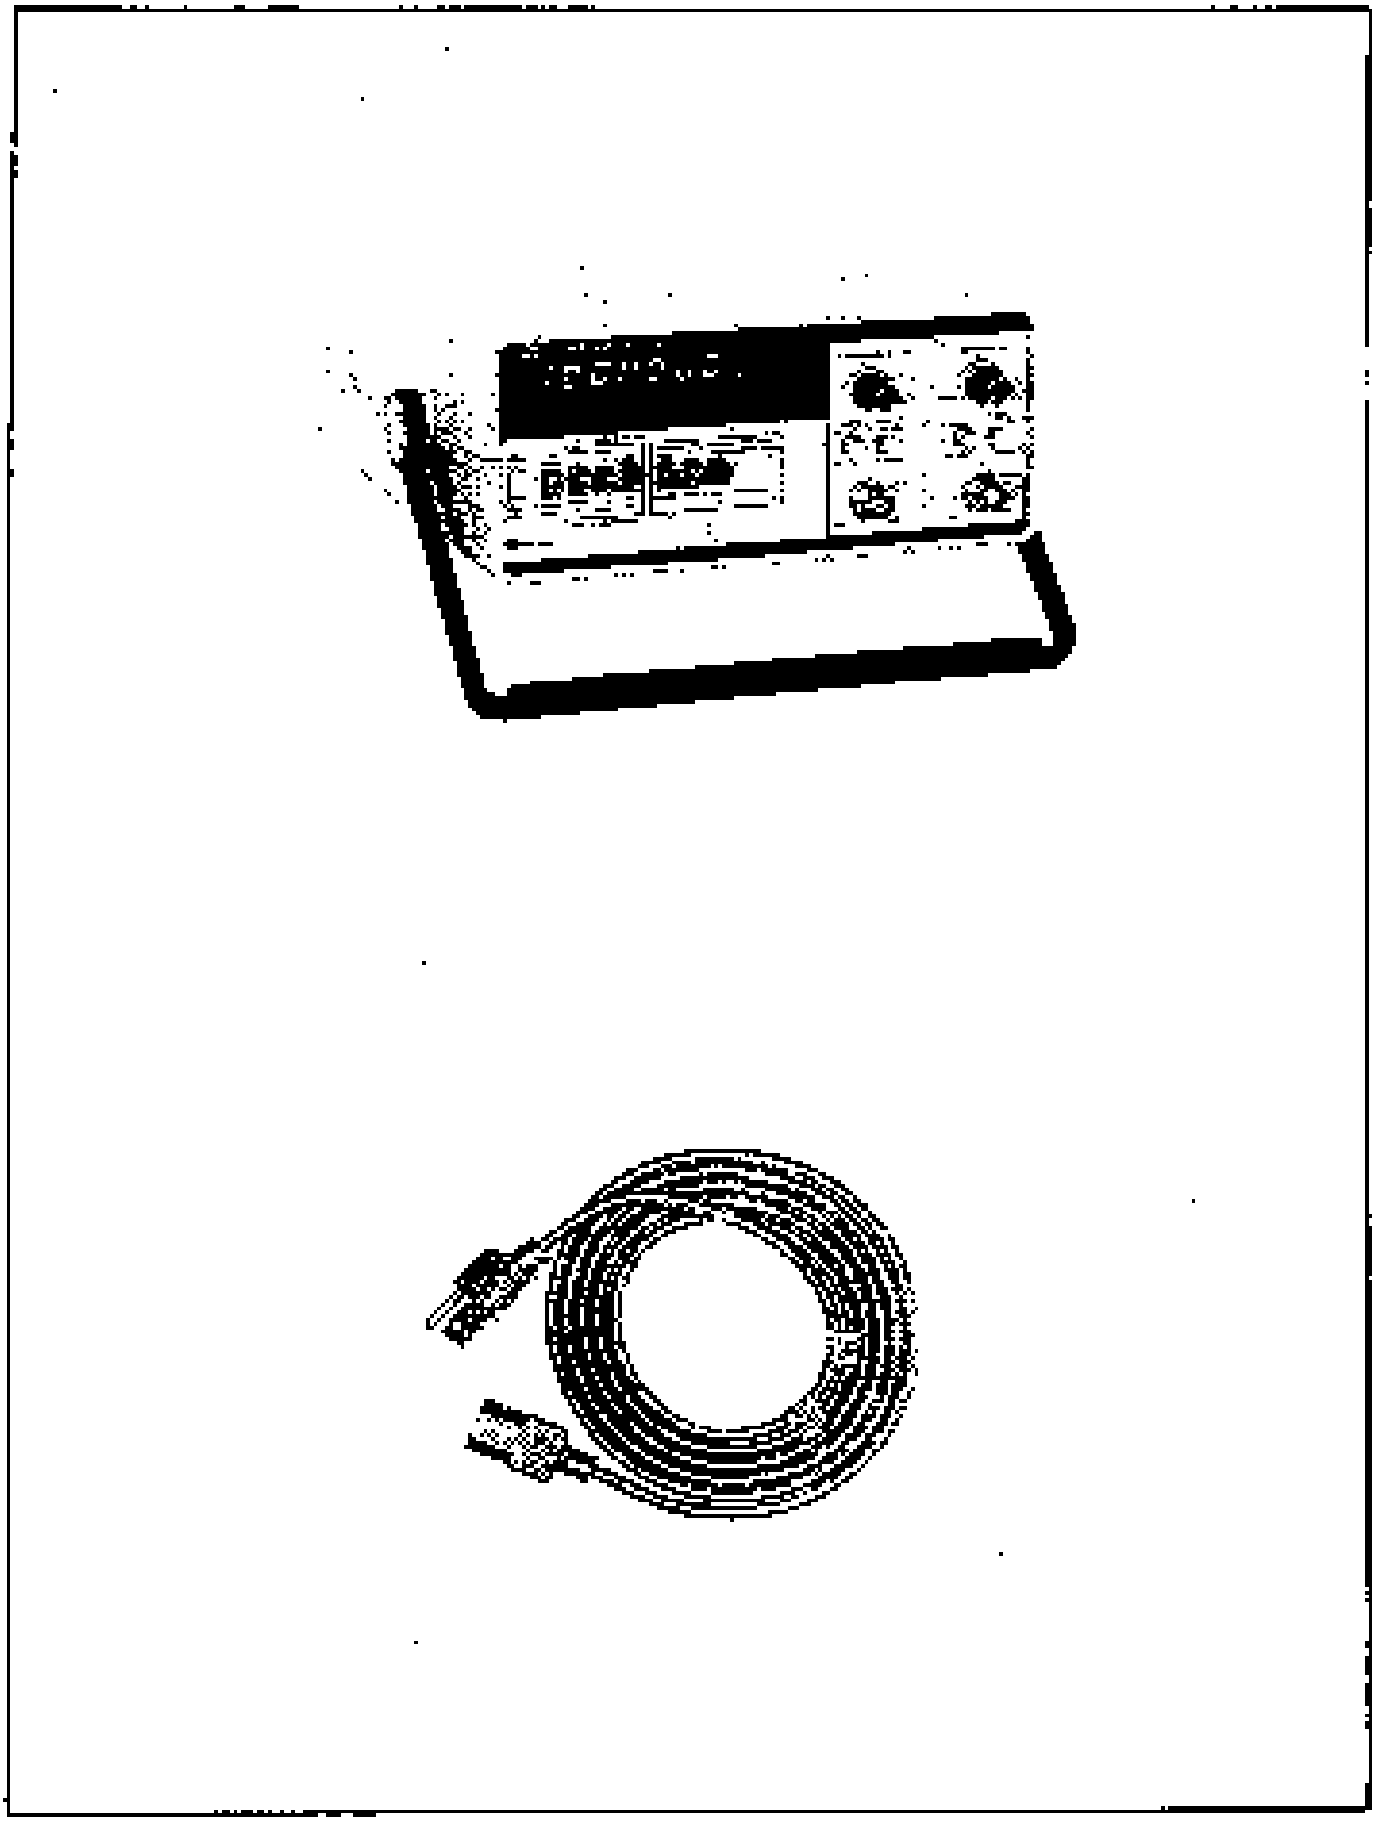

Figure 1-1. Model 5114A and Equipment Supplied

SECTION I
GENERAL INFORMATION

1-1. INTRODUCTION

1-2. This manual provides information pertaining to the installation, operation, testing, adjustment, and maintenance of the HP Model 5314A Universal Counter. Figure 1-1 shows the HP 5314A with the supplied equipment.

1-3. This operating and service manual is divided into eight sections, each covering a particular topic for the operation and service of the HP 5314A. The eight sections are listed here:

Section	Topic
I	General Information
II	Installation
III	Operation
IV	Performance Tests
V	Adjustments
VI	Replaceable Parts
VII	Manual Changes
VIII	Service

1-4. SPECIFICATIONS

1-5. Instrument specifications are listed in Table 1-1. These specifications are the performance standards or limits against which the instrument may be tested.

1-6. SAFETY CONSIDERATIONS

1-7. The HP 5314A Universal Counter is a Safety Class I instrument, designed according to international safety standards. This operating and service manual contains information, cautions, and warnings which must be followed by the user to ensure safe operation and keep the HP 5314A in safe operating condition.

1-8. INSTRUMENTS COVERED BY MANUAL

1-9. If the serial number prefix of your HP 5314A is lower than the serial number listed on the title page of this manual, the manual must be modified to agree with the HP 5314A. Refer to Section VII, Manual Changes, for the information which will adapt this manual to your HP 5314A. If the serial number prefix is higher, refer to the yellow "manual changes" sheet located inside the front cover.

1-10. The HP 5314A standard instrument, Option 001 and Option 002 are documented in this manual. The differences are noted in the appropriate sections such as Options in Section I, Replaceable Parts in Section VI, and Service in Section VIII.

1-11. INSTRUMENT IDENTIFICATION

1-12. The instrument serial number is located on the rear panel. Hewlett-Packard uses a two-section serial number consisting of a four-digit prefix and a five-digit suffix. A letter between the prefix and suffix identifies the country in which the instrument was manufactured (A=USA, G=West Germany, J=Japan, U=United Kingdom). All correspondence with Hewlett-Packard concerning this instrument should include the complete serial number.

Table 1-1. Specifications

INPUT CHARACTERISTICS

Range:
- Channel A: 10 Hz to 100 MHz
- Channel B: 10 Hz to 2.5 MHz

Sensitivity:

Channel A:
- 25 mV rms to 100 MHz
- 75 mV peak-to-peak minimum pulse width 5 ns

Channel B:
- 25 mV rms to 2.5 MHz
- 75 mV peak-to-peak minimum pulse width of 50ns

Coupling: AC

Impedance: 1 MΩ NOMINAL shunted by less than 40 pF

Attenuation: X1 or X10 NOMINAL (A Channel only)

Trigger Level:
Continuously variable ±40 mV (times attenuator setting) around average value of signal.

Slope: Independent selection of + or − slope

Channel Input: Switchable SEPARATE or COMMON A

Damage Level:

X1:	DC to 100 kHz	350V (DC + peak AC)
	100 kHz to 5 MHz	2.5 × 10⁷ (V)² Hz Product
	Above 5 MHz	5V rms
X10:	DC to 1 MHz	350V (DC + Peak AC)
	1 MHz to 50 MHz	2.5 × 10⁸ (V)² Hz Product
	Above 50 MHz	5V rms

FREQUENCY (A)

Range:
- 10 Hz to 10 MHz direct count
- 1 MHz to 100 MHz prescaled by 10

LSD Displayed: Direct count 0.1 Hz, 1 Hz, 10 Hz, 100 Hz, 1 kHz switch selectable. Prescaled 10 Hz, 100 Hz, 1 kHz switch selectable

Resolution: ± 1 MT

Accuracy: ± LSD ± (time base error) × FREQ

PERIOD (A)

Range: 10 Hz to 2.5 MHz

LSD Displayed:

$$\frac{100\ ns}{N} \quad \text{for } N = 1 \text{ to } 1000 \text{ in decade steps of } N$$

Resolution:

$$\pm \text{LSD} \pm 1.4 \times \frac{\text{Trigger Error}}{N}$$

Accuracy:

$$\pm \text{LSD} \pm 1.4 \times \frac{\text{Trigger Error}}{N} \pm (\text{time base error}) \times \text{PER}$$

TIME INTERVAL (A TO B)

Range: 250 ns to 1 s

LSD Displayed: 100 ns

Resolution: ± LSD ± START Trigger Error ± STOP Trigger Error

Accuracy: ± LSD ± START Trigger Error ± STOP Trigger Error ± (time base error) × TI

Time interval measurements require an arming signal for both the START and STOP channels. (See Paragraph 3-37.)

RATIO

Range:
- 10 Hz to 10 MHz Channel A
- 10 Hz to 2.5 MHz Channel B

LSD Displayed:

$$\frac{A}{B} \text{ part in } \frac{A}{B} \times N \text{ in decade steps of } N \text{ for } N = 1 \text{ to } 1000$$

Resolution:
- ± LSD ± (Trigger Error × FREQUENCY A/N)

Accuracy:
- ± 1 count of A ± (Trigger Error × FREQUENCY A/N)

TOTALIZE (A)

Range: 10 Hz to 10 MHz

Resolution: ± 1 count of input

GENERAL

Check: Crystal internal 10 MHz Oscillator

Display: 7-digit amber LED display with gate and overflow indication.

Maximum Sample Rate: 5 readings per second

Operating Temperature: 0°C to 50°C

Power Requirement:
115V, (+10%, −25%); 230V, (+10%, −15%); 48-66 Hz; 70 VA maximum.

Weight: 3.0 kg (6.6 lbs.)

Dimensions: 241 mm wide × 90 mm high × 320 mm long (9½" W × 3½" H × 12½" D)

TIME BASE

Frequency: 10 MHz

Aging Rate: <3 parts in 10^9 per month

Temperature: <±1 part in 10^6, 0°C to 50°C

Line Voltage: <±1 part in 10^9 for ±10% variation.

OPTIONS

Option 001: High Stability Time Base (TCXO)
- Frequency: 10 MHz
- Aging Rate: <1 part in 10^9 per month
- Temperature: <±1 part in 10^8, 0°C to 40°C
- Line Voltage: <±1 part in 10^9 for ±10% variation

Option 002: Battery
- Type: Rechargeable lead-acid sealed
- Capacity: TYPICALLY 4 hours minimum operation at 25°C
- Recharging Time: TYPICALLY 16 hours to 95% of full charge, instrument non-operating. Charging circuitry included with option. Batteries cannot charge during instrument operation.
- Battery Voltage Sensor: Automatically shuts instrument off when low battery condition exists
- Line Failure Protection: Instrument automatically switches to batteries in case of line failure
- Weight: Option 002 adds 1.5 kg (3.3 lbs.) to weight of instrument.

WARRANTY

ALL COMPONENTS WITHIN OPTION 002, EXCEPT THE BATTERY, ARE WARRANTED FOR ONE FULL YEAR. BATTERY PART (HP PART NO. 5420-0253) IS WARRANTED FOR 90 DAYS.

DEFINITIONS

Resolution: Smallest discernible change of measurement result due to a minimum change in the input.

Accuracy: Deviation from the actual value as fixed by universally accepted standard of frequency and time.

Trigger Error:

$$\frac{\sqrt{(100\ \mu V)^2 + (\text{rms noise})^2}}{\text{Input Slew Rate at Trigger Point (V/s)}} \quad \text{(rms)}$$

Where 100 μV is the rms noise of the input for a 100 MHz bandwidth on Channel A and a 10 MHz bandwidth on Channel B.

LSD: Least Significant Digit.

1-13. This instrument has a two-part serial number. The first four digits and the letter comprise the serial number prefix. The last five digits form the sequential suffix that is unique to each instrument. The contents of this manual apply directly to instruments having the same serial number prefix(es) as listed under SERIAL PREFIX on the title page.

1-14. An instrument manufactured after the printing of this manual may have a serial prefix that is not listed on the title page. This unlisted serial prefix indicates that the instrument is different from those documented in this manual. The manual for this instrument is supplied with a yellow Manual Changes supplement which contains change information that documents the differences.

1-15. DESCRIPTION

1-16. The HP 5314A is a 100 MHz/100 ns Universal Counter. It features a seven-digit seven-segment LED display with overflow indication, seven function performance, and full input signal conditioning. There are two options available for the 5314A. They are a Temperature Compensated Crystal Oscillator (TCXO) Option 001 and a battery pack for portable operation (Option 002).

1-17. The seven functions are: Frequency, Single Shot Period, Period Average, Time Interval, Totalize, Ratio, and Self Check. This is accomplished by a single LSI integrated circuit. The input signal is AC coupled and can be conditioned as follows: slope, trigger level, and attenuation.

1-18. OPTIONS

1-19. The following is a list of options available for the 5314A Universal Counter.

NOTE

A brief description of the options is given in *Table 1-1, Specifications*. For more information concerning the options for the HP 5314A, contact your local HP Sales and Service Office. A list of HP Sales and Service offices is provided at the back of this manual.

Hardware Options

001	High Stability Time Base (TCXO)
002	Battery with Built-in Charger

NOTE

One of the following hardware options must be included with each order.

115	Line operating voltage factory set at 115V nominal (90V to 127V) ac
230	Line operating voltage factory set at 230V nominal (198V to 250V) ac

Support Options

W30	Three-year customer return repair coverage
W32	Three-year customer return calibration coverage
W34	Three-year customer return Standard Compliant Calibration Service
W50	Five-year customer return repair coverage
W52	Five-year customer return calibration coverage
W54	Five-year customer return Standard Compliant Calibration service

Support options are available only at time of purchase. Service contracts are available from HP for customers or instruments which did not include support options at time of purchase. For information, contact your nearest Hewlett-Packard Sales and Service Office listed at the back of this manual.

For field installation of Options 001 and 002, refer to paragraph 2-14, Installation of Options 001 and 002.

1-20. EQUIPMENT SUPPLIED

1-21. Table 1-2 lists the only equipment supplied with the HP 5314A.

Table 1-2. Equipment Supplied

DESCRIPTION	HP PART NO.
Detachable Power Cord 229 cm (7½ feet) long	8120-1378

1-22. RECOMMENDED TEST EQUIPMENT

1-23. The test equipment listed in table 1-1 is recommended for use in making performance tests, adjustments, and trouble shooting. Substitute test equipment may be used if it meets the required characteristics listed in the table.

Table 1-1. Recommended Test Equipment

Instrument Type	Required Characteristics	HP Model No. Recommended
Time Oscillator	10 MHz, 25 mV rms	3314A
Signal Generator	100 MHz, 25 mV rms	8640B
50 ohm Termination	1W Minimum Dissipation	11048C
Digital Voltmeter	10 mV rms	3466A
Oscilloscope 100 MHz	10 mV 10 mV	1741A
Function Generator	25 MHz, 25 mV rms	3312A

SECTION II
INSTALLATION

2-1. INTRODUCTION

2-2. This section provides all information necessary to install the HP 5314A. Covered in this section are initial inspection, preparation for use, field installation options, operating environment, and repackaging for shipment.

2-3. INITIAL INSPECTION

2-4. Inspect the shipping container for damage. If the shipping container or cushioning material is damaged, it should be kept until the contents of the shipment have been checked for completeness and the instrument has been checked mechanically and electrically. The contents of the shipment should be as shown in Figure 1-1. Procedures for checking electrical performance are given in Section IV. If the contents are incomplete, if there is mechanical damage or defect, or if the instrument does not pass the electrical performance test, notify the nearest Hewlett-Packard office. If the shipping container is damaged, or the cushioning material shows signs of stress, notify the carrier as well as the Hewlett-Packard office. Keep the shipping material for the carrier's inspection.

2-5. PREPARATION FOR USE

2-6. Power Requirements

2-7. The HP 5314A requires a power source of 115V, −10%, +25%; 230V, −17%, +9%; 48-66 Hz, 18 VA maximum. Power consumption is 10 watts maximum.

2-8. Line Voltage Selection

CAUTION

BEFORE SWITCHING ON THIS INSTRUMENT, make sure the instrument is set to the voltage of the power source. The voltage at which the unit has been factory set, is indicated on the rear panel label.

2-9. Line voltage selection is determined by the position of the line voltage selector switch located inside the instrument on the 82-05574-80002 power supply assembly. Line voltage is preset at the factory for 115V (103V to 126V) or 230V (207V to 253V) as ordered by User (customer). If changing of the line voltage becomes necessary, follow the procedure in Table 2-1.

Table 2-1. Line Voltage Changing Procedure

WARNING
THE POWER CORD SHOULD BE DISCONNECTED FROM THE REAR OF THE HP 5314A BEFORE STARTING THIS PROCEDURE.

1. Turn the HP 5314A upside down and remove the four screws near the corners on the cabinet bottom.

2. Holding the top and bottom covers together, turn the HP 5314A right side up and carefully lift the top cover. This exposes the line voltage selector switch located on the A2 [05314-60006] power supply assembly (large pc assembly located in the rear of the cabinet).

3. The two-position switch may now be properly set to match the input voltage (115 for 85V to 126V input or 230 for 172V to 252V input).

4. Replace the top cover and carefully turn the unit upside down. Replace and tighten the four screws, one in each corner of the cabinet bottom.

NOTE

The line voltage selector switch automatically selects the correct line input fuse configuration. The two fuses are located on the A2 assembly and are in series for 230V selection, and in parallel for 115V selection.

2-10. Power Cable

2-11. The HP 5314A is shipped with a three-wire power cable. The type of power cable plug shipped with the instrument depends on the country of destination. Refer to Figure 2-1 for the part numbers of the power cable and plug configurations available.

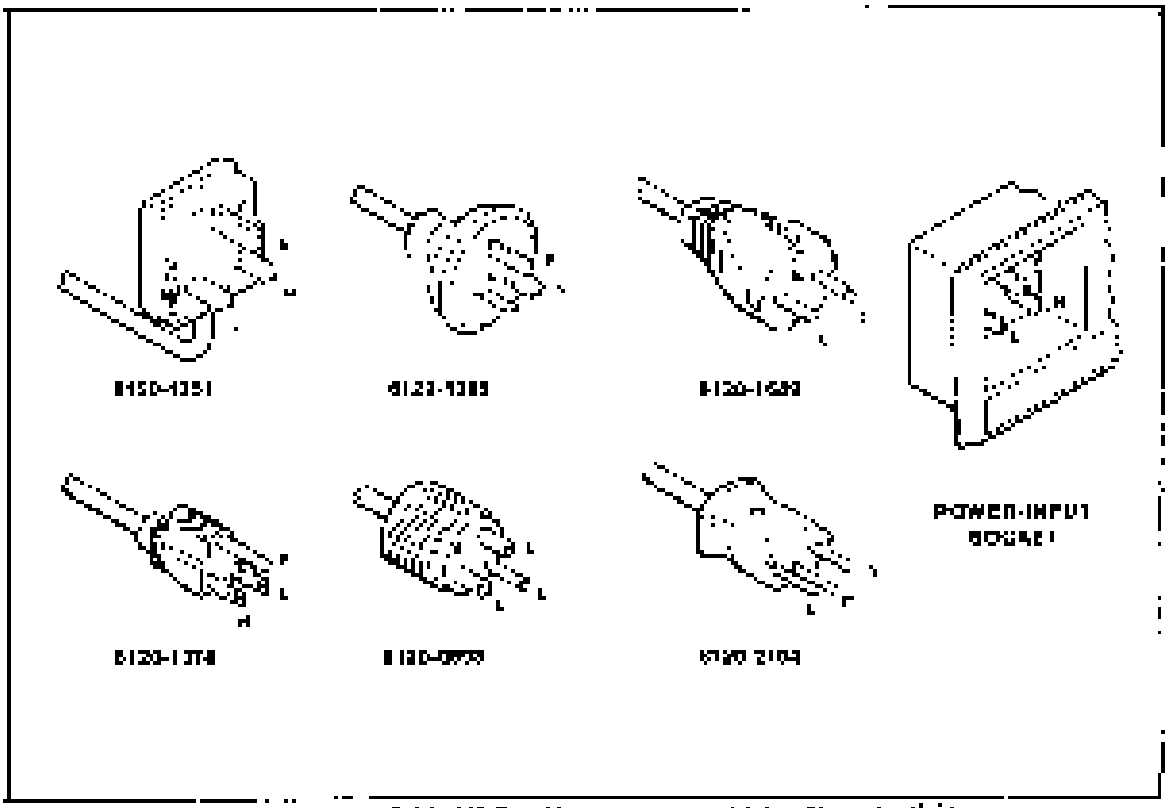

Figure 2-1. Power Cable HP Part Numbers vs. Mains Plugs Available

2-12. Bench Operation

2-13. The HP 3314A has an adjustable handle, and two rubber strips cemented at the rear of the cabinet bottom. For convenience in bench operation, pull out the ends of the handle and adjusting it, the front of the HP 3314A may be raised for easier viewing of the front panel. The four rubber strips on the cabinet bottom keep the HP 3314A from sliding on smooth surfaces.

2-14. INSTALLATION OF OPTIONS 001 AND 002

2-15. For installation of Options 001 and 002, refer to tables 2-2 and 2-3, respectively. Field installation of either option should be performed by qualified service personnel only.

2-16. OPERATING ENVIRONMENT

2-17. In order for the HP 3314A to meet the specifications listed in Table 1-1, the operating environment must be within the following limits.

Temperature	0° to +55°C
Humidity	<95% relative
Altitude	<15,000 feet

2-18. STORAGE AND SHIPMENT

2-19. Environment

2-20. The instrument should be stored in a clean, dry environment. The following environmental limitations apply to both storage and shipment:

Temperature	−40°C to +75°C
Humidity	<95% relative
Altitude	<50,000 feet

2-21. Packaging

2-22. ORIGINAL PACKAGING. Containers and materials equivalent to those used in factory packaging are available through Hewlett-Packard offices. If the instrument is being returned to Hewlett-Packard for servicing, attach a tag identifying the type of service required, return address, model number, and full serial number. Also, mark the container FRAGILE to assure careful handling. In any correspondence, refer to the instrument by model number and full serial number.

2-23. OTHER PACKAGING. The following general instructions should be used for repackaging with commercially available materials:

a. Wrap the instrument in heavy paper or plastic. If shipping to a Hewlett-Packard office or service center, attach a tag indicating the type of service required, return address, model number, and full serial number.

b. Use a strong shipping container. A double-wall carton made of 350-pound test material is adequate.

c. Use enough shock-absorbing material (3 to 4 inch layer) around all sides of the instrument to provide firm cushion and prevent movement inside the container. Protect the control panel with cardboard.

d. Seal the shipping container securely.

e. Mark the shipping container FRAGILE to assure careful handling.

Table 3-7. Option 001 Installation Instructions

NOTE

Installation of Option 001 (TCXO) should be performed by qualified service personnel only.

Option 001 consists of the following parts:

HP Part Number	Qty.	Description
05314-60004	1	TCXO Assembly
0380-0644	4	Spacer (1.0)
2360-0115	4	6-32 x 5/8" Machine Screw
2360-0119	1	6-32 x 1.00" Machine Screw
2420-0001	2	6-32 Nut

PRELIMINARY

1. Turn off the HP 5314A and remove the AC power cord.
2. Turn the HP 5314A upside down and remove the four screws near the corners of the cabinet bottom.
3. Holding the top and bottom cover together, turn the HP 5314A right side up and carefully remove top cover.
4. Remove the handle.

There are two sets of instructions for installing Option 001. The first set (Procedure 1) is used to install Option 001 into a standard HP 5314A. The second set (Procedure 2) is used to install Option 001 into an HP 5314A with Option 003.

Procedure 1

Installation of Option 001 into standard HP 5314A

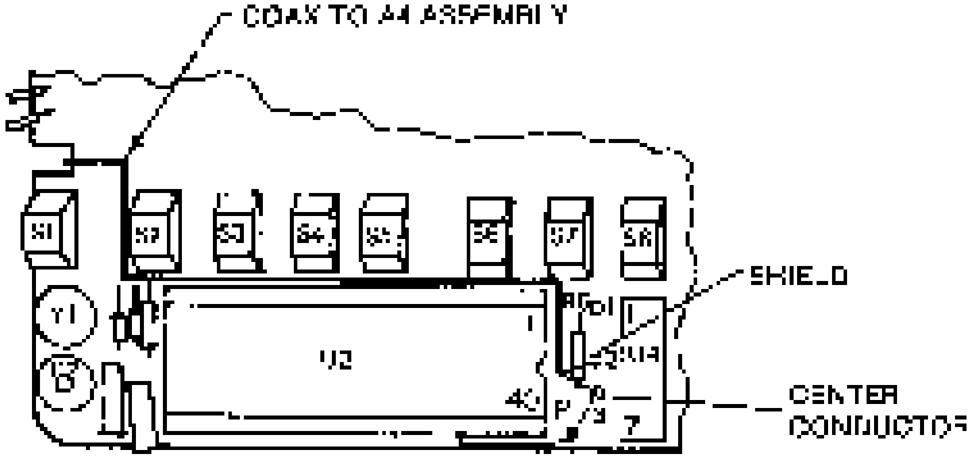
1. Remove the remaining two plastic spacers which hold the A1 assembly in the cabinet in place.
2. Carefully lift the A1 assembly out of the cabinet bottom.
3. Locate the two holes in the pc board between the large electrolytic capacitor (A2C1) and the power transformer (A2T1). These holes are the mounting holes for the Option 001 A4 (HP 05314-60004) assembly. They provide the +5V and ground (⏚) for the A4 assembly.
4. Mount the A1 assembly to the A2 assembly with the component side of A4 toward the large electrolytic. Use the Alpo-tec hardware (short 6-32 screw on rear chassis mounting lug and long 6-32 screw and 1 inch spacer on the front mounting lug. See Figure 3-2, "Top Internal View," for correct positioning.
5. Remount the combination A2/A4 assembly into the HP 5314A cabinet bottom being careful to properly align the rear panel slots and rear line card input block. Reinstall the two black plastic spacers.
6. Group the combination front panel and A1 assembly and carefully lift away from the cabinet bottom.
7. Use an Allen wrench to remove the two front panel LEVEL knobs.
8. Use a 5/16" nutdriver to remove the two front panel mounting nuts and the two BNC input jacks.
9. Remove the combination front panel window from the A1 assembly.
10. Locate jumper wire W1 on the A1 assembly between A1U2 and A1U10. If Option 003 is not being installed, remove W1.

NOTE

Instruments with TCXO Option 001 require addition of diode A1CR4 on circuit board A1. See Figure 6-5 for A1 R4 location between A1U2 and A1C7 in lower left corner of illustration. If Option 003 is being installed, add A1CR4 diode (HP Part No. 1901-0050).

Table 2-2. Option 001 Installation Instructions (Continued)

11. Referring to the sketch below, solder the coax cable from the Option 001 A4 assembly to the component side of the A1 assembly as follows: Solder the shield to the solder pad labeled ❼ in the sketch and the center conductor to the solder pad labeled ❶ in the sketch. The solder pad labeled ❶ is left open. Use the diagonal cutters to clip any protruding wire on the circuit side of A1.



12. Dress the coaxial cable between U2 and the switch pack as shown in the sketch. Lead the coax through the cutout on the side of the A1 assembly with the rest of the cables.

13. Assemble the front panel to A1 and secure with a 3/8" BNC nut.

14. Replace the LEVEL knobs, being careful to center them between the + and − positions. Tighten with Allen wrench from the HP 5314A kit.

15. Installation of Option 001 into standard HP 5314A is now complete. IMMEDIATELY proceed to step 4 (PRELIMINARY) of Table 5-3, Option 001 Adjustment.

Procedure 2:

Installation of Option 001 into HP 5314A with Option 002.

1. Remove the red and black cables of the A1 assembly from the battery pack by pulling on the terminal lugs.
2. Remove the screw which holds the battery and A3 assembly to the cabinet bottom.
3. Carefully remove the A3 assembly by first pulling the assembly toward the battery and second, lifting the assembly.
4. Remove the two (two) black plastic spacers which hold the battery in place. Lift the battery out of the cabinet bottom.
5. Perform steps 1 through 14 of Procedure 1 in this table. Then return and continue with step 6.
6. Install the battery pack into the cabinet bottom. Mount the two (two) black plastic spacers.
7. Install the A1 assembly into J1 of the A3 assembly but DO NOT connect the red or black cable to the battery.
8. Insert and tighten the hold-down screw for the A3 assembly.
9. Connect the red and black cables to the battery's positive and negative posts, respectively. Turn the HP 5314A ON.
10. Installation of Option 001 into an HP 5314A with Option 002 is now complete. IMMEDIATELY proceed to step 4 (PRELIMINARY) of Table 5-3, Option 001 Adjustment.

Table 2-1. Option 002 Installation Instructions

NOTE

Installation of Option 002 (battery pack) should be performed by qualified service personnel only.

Option 002 consists of the following parts:

HP Part Number	Qty.	Description
03314-60002	1	Battery Charger Assembly
1420-0032	1	6V Lead-Acid Battery
03314-00002	1	Battery Bracket
3030-0063	1	6-32 x 1.5" Machine Screw

1. Turn off the HP 3314A and remove the AC power cord.
2. Turn the HP 3314A upside down and remove the four screws near the corners of the cabinet bottom.
3. Holding the top and bottom covers together, turn the HP 3314A right side up and carefully lift off the top cover.
4. Remove the front two screws (plastic washers and washers) securing the combination front panel and A1 assembly. Discard the washers only.
5. Assemble the battery and battery hold down bracket, matching the polarity of the battery with that shown on the hold down bracket.
6. Install the A1-A3 interconnect cable assembly between the lower left corner of the cabinet bottom.
7. Install the battery pack and A3 assembly as follows:
   a. Secure the two spacer studs on the front of the cabinet bottom (approximately 1.50" behind the combination front panel A1 assembly).
   b. Mount the battery pack and bracket on the two spacer studs go through the two large holes on the bracket and the battery pack (1 and 2) and pointing toward the A2 assembly (rear of the cabinet).
   c. Locate the Option 002 A3 assembly (03314-60003). Lay the assembly on a flat surface component side up and check the two cables (red and black) so they come straight up (perpendicular) from the assembly.
   d. Install the A3 assembly (03314-60003) component-side up into A2P1 the 6-pin plastic board connector on the A2 power supply assembly.
   e. Install a 6-32 screw through the board assembly/battery mounting bracket and secure them to the cabinet bottom.

NOTE

Make sure the HP 3314A power switch is in the OUT position.

   f. Connect the red cable to the "+" post of the battery pack.
   g. Connect the black cable to the "-" post of the battery pack.
   h. Insert the two black plastic spacers (without washers) onto the front spacer studs.
   i. Installation of Option 002 is now complete. IMMEDIATELY proceed to step 4 of Table 2-1, Battery Charging Voltage Adjustment.

SECTION III
OPERATION

3-1. INTRODUCTION

3-2. This section provides complete operating information needed for the HP 5314A Universal Counter. This section includes a description of all front panel controls, connectors and indicators, operating instructions, operator's checks, and operator's maintenance.

3-3. OPERATING CHARACTERISTICS

3-4. The following paragraphs describe the operating ranges and resolution for frequency, period, time interval, ratio A/B, totalize A, and self check functions.

3-5. Frequency Measurements

3-6. All frequency measurements are made through the A channel input. The frequency range is 10 Hz to 10 MHz direct count and 100 Hz to 100 MHz prescaled by 10, with a minimum input level of 25 mV rms or 75 mV p-p with a minimum pulse width of 5 nanoseconds. The attenuator setting. The resolution is 0.1 Hz for frequencies up to 10 MHz. With frequencies above 10 MHz (prescaled input), the resolution is 10 Hz. See figure 3-3 for a typical frequency measurement setup.

3-7. Period Measurements

3-8. All period measurements are made through the A channel input. The signal can be a sine wave, square wave, or a waveform whose components lie between 10 Hz and 2.5 MHz. The period ranges are 100 ns to 100 ms (10 Hz to 2.5 MHz). The sensitivity is 25 mV rms or 75 mV p-p. The resolution is 100 ns. See figure 3-4 for a typical period measurement setup.

3-9. Time Interval Measurements

3-10. The counter measures time intervals from Channel A to Channel B; that is, Channel A starts the measurement and Channel B stops the measurement. Time between points on a single waveform can be measured by connecting the input signal to CHANNEL A jack and placing the Input Amplifier Control switch to COM A. Under these conditions, the slope and level controls of Channel A and Channel B allow variable triggering anywhere on the + or - slope. With the Input Amplifier Control switch set to SEP, measurements can be made between points on separate waveforms. The time interval range is 250 ns to 1 s. The sensitivity is 25 mV rms (75 mV p-p). The resolution is 100 ns. See figures 3-5 and 3-6 for typical time interval measurement setups.

3-11. INITIATING A MEASUREMENT. The HP 5314A does not internally arm itself in time interval. Both Channels A and B must be externally armed before a time interval measurement can be initiated, see figure 3-1. Each channel is armed by the first positive or negative edge (corresponding to the slope selection setting) of the input signal. Channel A is armed first. Channel B ignores all input edges until Channel A is armed. Once Channel A is armed, the first positive or negative edge (corresponding to the slope selection setting) arms Channel B. Until Channel B is armed, Channel A ignores any further input edges. Once Channel B is armed, the next slope selected edge in Channel A starts the time interval measurement, and the next slope selected edge in Channel B stops the time interval measurement.

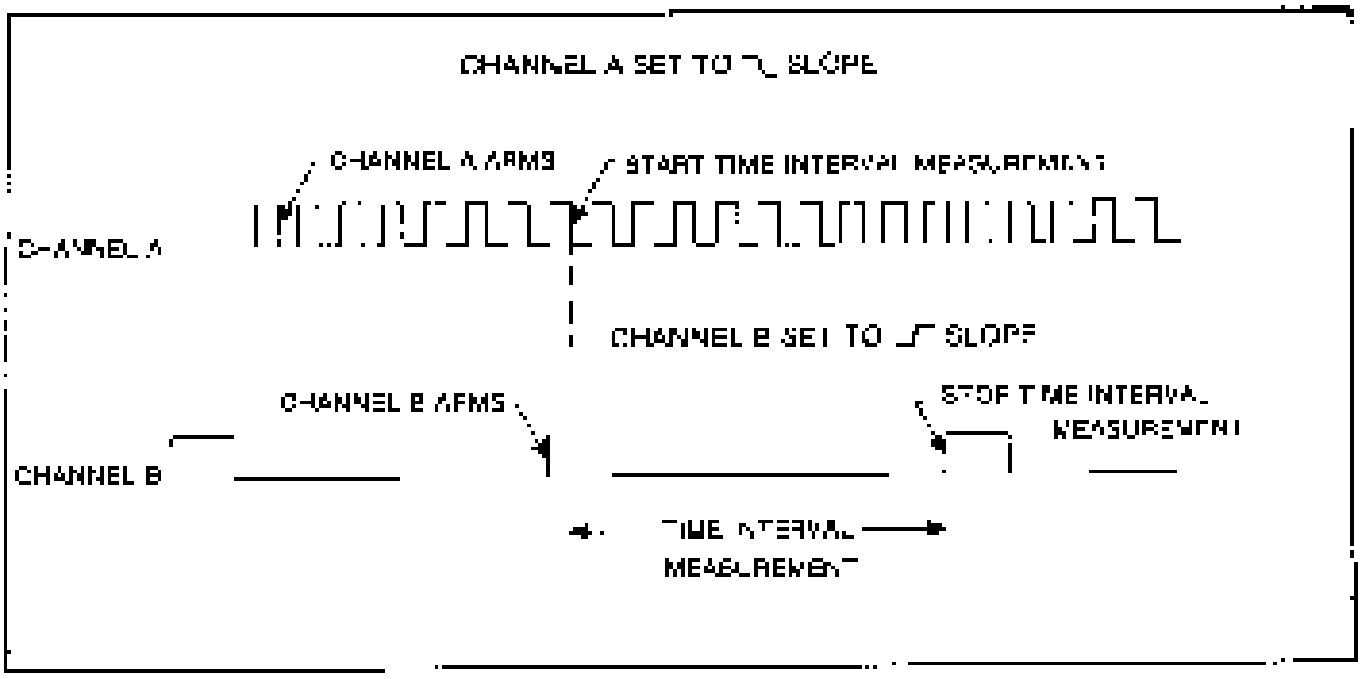


Figure 3-1. Time Interval Measurement Routine

3-12. Ratio A to B Measurements

3-13. The ratio between two frequencies (fA/fB) is measured by connecting one signal to Channel A and the other to Channel B. Channel A operates in the range of 10 Hz to 70 MHz. Channel B operates in the range of 10 Hz to 2.5 MHz. If the higher frequency is connected to Channel A, the ratio will be greater than one. The answer for a ratio measurement is a unitless figure. See Figure 3-7 for a typical ratio measurement setup.

3-14. Totalize A Measurements

3-15. The HP 5314A can totalize counts from 10 Hz to 70 MHz with a resolution of 1 count. Input frequencies between 10 Hz and 100 MHz may be totalized in the prescale mode (see Figure 3-8) with a resolution of 10 Hz. The HOLD switch may be used to latch the display. However, the counter continues to increment and when the HOLD is released the updated count is displayed. See Figure 3-8 for a typical totalize measurement setup.

3-16. Self-Check

3-17. The HP 5314A contains a built in self-check function. The self-check mode programs the unit to make a frequency measurement using its internal 10 MHz time base. For details concerning self-check, see Figure 3-9, Operator's Checks.

3-18. PANEL FEATURES

3-19. Front panel features of the HP Model 5314A are described in Figure 3-2, Front Panel Controls and Connectors. Contained in Figure 3-2 is a description of each of the controls and connectors. Description numbers match the numbers on the illustration.

3-20. OPERATING INSTRUCTIONS

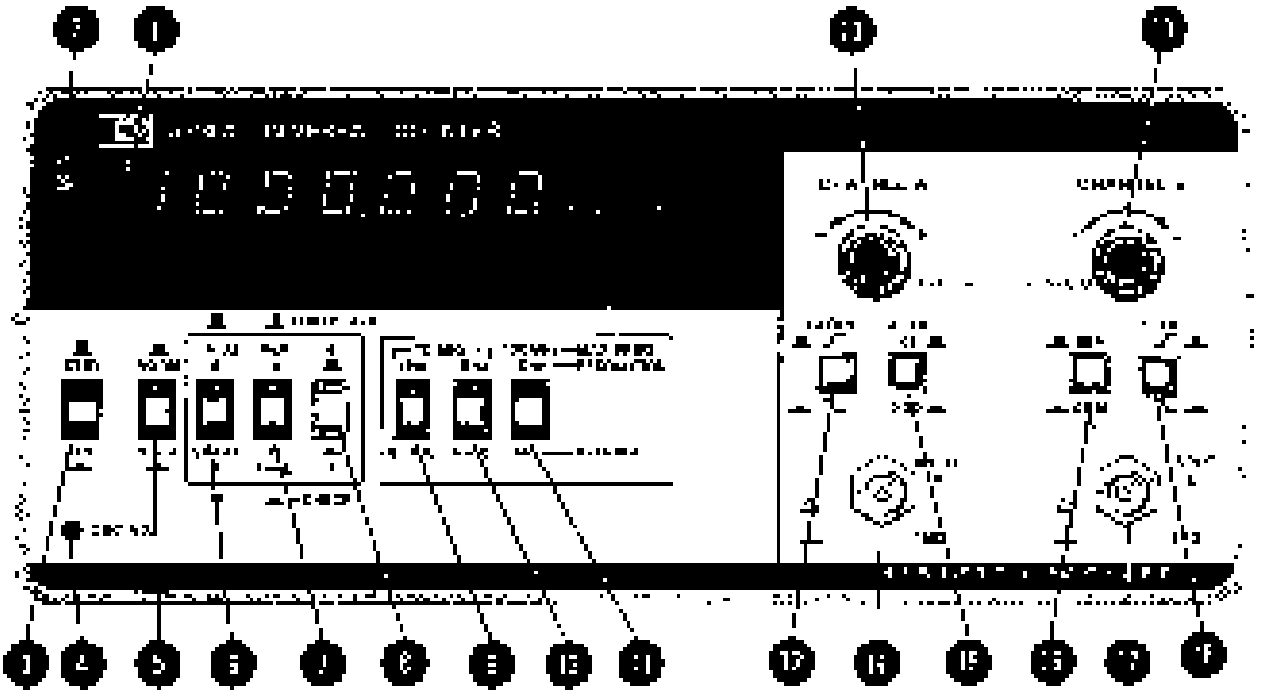
3-21. General operating procedures with the HP Model 5314A Universal Counter connected to typical measurement setups are shown in figures 3-3, 3-4, 3-5, 3-6, 3-7, and 3-8. Many other applications are possible but not shown because the general operating procedure is the same. Description numbers match the numbers on the illustration.

3-22. OPERATOR'S MAINTENANCE

3-23. There is no operator's maintenance for the HP 5314A. All maintenance should be performed by qualified service personnel only.

3-24. Power/Warm-Up

3-25. The HP 5314A has a two position power switch, STBY and ON. For HP 5314A models with Option 002, it is important that the instrument be connected to the power source in the STBY mode when not in use. This supplies power to the battery charging circuitry.



4	GATE	The gate light when lit indicates the main gate is open and a measurement is in progress.
5	OVERFLOW	LED annunciator which lights when one or more of the most significant digit digits eliminated from the decimal point are no displayed. However, the counter continues to count correctly although the digits are only represented to the extent of the time base.
6	POWER	Supplies power to the entire instrument in the ON position. Sustains power only to the Option 001 battery charging circuits in STBY position.
7	OSC ADJ	Front panel window allowing access to the oscillator frequency adjustment capacitor (A10C2).
8	NORM/HOLD	In HOLD, switch IN, the measurement in progress is stopped, the main counter is reset, and the HP 5314A is held ready to make a new measurement. The display is not updated so the last complete measurement is displayed. When switched back to NORM, a new measurement is started. In totalize, when placed in HOLD, the display is held but the counter continues to increment. When the HOLD is released, the display is updated and resumes counting.
9	FREQ A START A	With this switch IN, the HP 5314A is placed in the frequency or totalize (START) mode as determined by the position of the blue shift key 1.
10	PER A T.I. A→B	With this switch IN, the HP 5314A is placed in either period or time interval mode as determined by the position of the blue shift key 1.

Figure 3-2. Front Panel Controls and Connectors

NOTE

There are two additional functions which are selected using combinations of switches [illegible] and [illegible]. These two functions are Self Check and Ratio A to B. For self check mode, place both function switches [illegible] and [illegible] in the IN position. The instrument is now making a frequency measurement on the internal 10 MHz time base. Activating switches [illegible] and [illegible] causes 10 MHz to be displayed. Activating switch [illegible] causes 100 MHz to be displayed. Resolution selection switches can now be checked for proper operation. For Ratio A to B, place both function switches [illegible] and [illegible] in the OUT position. For more details on Ratio A to B, refer to paragraph 3-12 and Figure 3-7.

[illegible] SHIFT KEY — IN/OUT position determines the function selected by keys [illegible] and [illegible]. IN position selects the bottom row functions. OUT position selects the upper row functions.

NOTE

The following three switches [illegible], [illegible], [illegible] are dual purpose. Depending on the function selected (Frequency, Period, Ratio, etc.) the switches either represent the resolution and (sometimes gate time) or the sample size (N samples).

[illegible] 1 Hz/N 100 — In frequency (10 Hz to 10 MHz), this switch, when IN, gives a display with a 1 Hz resolution (1 second gate time). For frequencies between 10 MHz and 100 MHz, see the explanation for switch [illegible]. In period, this switch, when IN, causes the HP 5314A to measure 100 periods and display the average value in microseconds. In ratio, this switch when IN causes the HP 5314A to make 100 measurements and display the average ratio. This switch does not improve accuracy beyond 100 nanoseconds for time interval measurements.

[illegible] 10 Hz/N 10 — In frequency (10 Hz to 10 MHz), this switch, when IN, gives a display with a 10 Hz resolution (100 millisecond gate time). For frequencies between 10 MHz and 100 MHz, see the explanation for switch [illegible]. In period, this switch, when IN, causes the HP 5314A to measure 10 periods and display the average value in microseconds.

In ratio, this switch, when IN, causes the HP 5314A to make 10 measurements and display the average ratio. This switch does not improve accuracy beyond 100 nanoseconds for time interval measurements.

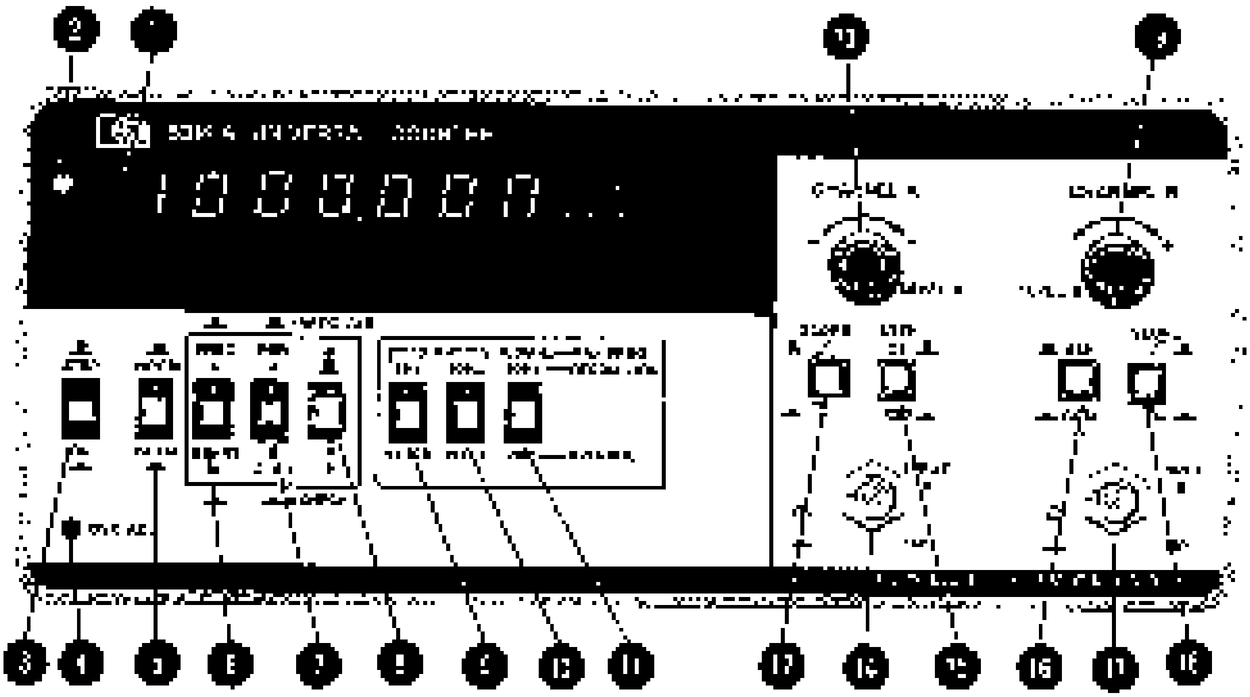
NOTE

There is another resolution available using switches [illegible] and [illegible] in addition to the ones called out on the front panel. It is 0.1 Hz/N 1000. This is generated when switches [illegible], [illegible] and [illegible] are in the OUT position. In frequency (10 Hz to 10 MHz), with these three switches out, the HP 5314A gives a display with 0.1 Hz resolution (10 second gate time). For frequencies between 10 MHz and 100 MHz, see the explanation for switch [illegible]. In period, with these three switches out, the HP 5314A measures 1000 periods and displays the average value in microseconds. In ratio, with these three switches out, the HP 5314A makes 1000 measurements and displays the average ratio. This switch combination does not improve accuracy beyond 100 nanoseconds for time interval measurements.

Figure 3-2. Front Panel Controls and Connectors (Continued)

❶	10 Hz/INT	This switch when IN, prescales the Channel A input signal through a divide by 10 prescaler circuit when FREQ A/START A switch ❸ is in. This switch MUST be used for frequencies between 10 MHz and 100 MHz. In frequency, this switch when IN prescales the input by 10 and gives a display with a 10 Hz resolution (prescale by 10 with a 1 second gate time). This switch and switch ❷ (1 Hz/INT 100) prescales the input and gives a display with a 100 Hz resolution (prescale by 10 with a 100 millisecond gate time). This switch and switch ❷ (10 Hz/INT 10) prescales the input and gives a display with a 1 Hz resolution (prescale by 10 with a 10 millisecond gate time). In Period, this switch IN causes the HP 5314A to measure 1 period and display the value in microseconds (the switch must be in for single-shot period measurements). In Ratio, this switch IN causes the HP 5314A to make 1 measurement and display the result (this switch is used for single-shot ratio measurements). In Time Interval, this switch should be pressed. This programs the HP 5314A to make single-shot time interval measurements. In Totalize, the HP 5314A counts the input directly (10 Hz to 10 MHz) and overlaps in series with this switch IN. The input is prescaled by 10 and the overlaps in kilounits. This switch MUST be used in START A for signals above 10 MHz.
❷	1 Hz/INT 100	See ❶ 10 Hz/INT.
❸	FREQ A/START A	Input amplifier control switch. a. START A - Allows independent operation of A and B channels. b. COMM A - Conveniently connects Channels A and B in parallel. Used for single source time interval measurements. Channel B input jack is not active. The input impedance remains the same as in SEP.
❹	INPUT A	BNC connector for the A channel signal input. The input impedance is 1 MegΩ. For more information on the input signal, refer to Table 1-1, Specifications.
❺	ATTN	Channel A input signal attenuator switch used in conjunction with the LEVEL control to set the trigger point. The input signal is not affected in X1 position. Input signal amplitude is reduced by a factor of 20 in the X20 position.
❻	SEP/COMM A	Input amplifier control switch. a. SEP - Allows independent operation of A and B channels. b. COMM A - Conveniently connects Channels A and B in parallel. Used for single source time interval measurements. Channel B input jack is not active. The input impedance remains the same as in SEP.
❼	INPUT B	BNC connector for the B channel signal input. The input impedance is 1 MegΩ. For more information on the input signal, refer to Table 1-1, Specifications.
❽	SLOPE	This switch setting determines which slope of the Channel B input signal will be used at the trigger point.
❾	LEVEL B	LEVEL control used to select the relative voltage at which triggering occurs. When switch ❻ is in SEP, the trigger voltage varies approximately ±3.2 V. When switch ❻ is in COM A, the trigger voltage varies approximately ±160 mV times the attenuator switch ❺ setting. The input amplifiers are dc coupled. The actual dc level of the trigger point is unknown.

Figure 3-2. Front Panel Controls and Connectors (Continued)



NOTE

See Table 1-1 for the specifications on all input signals concerning bandwidth, accuracy, and amplitude.

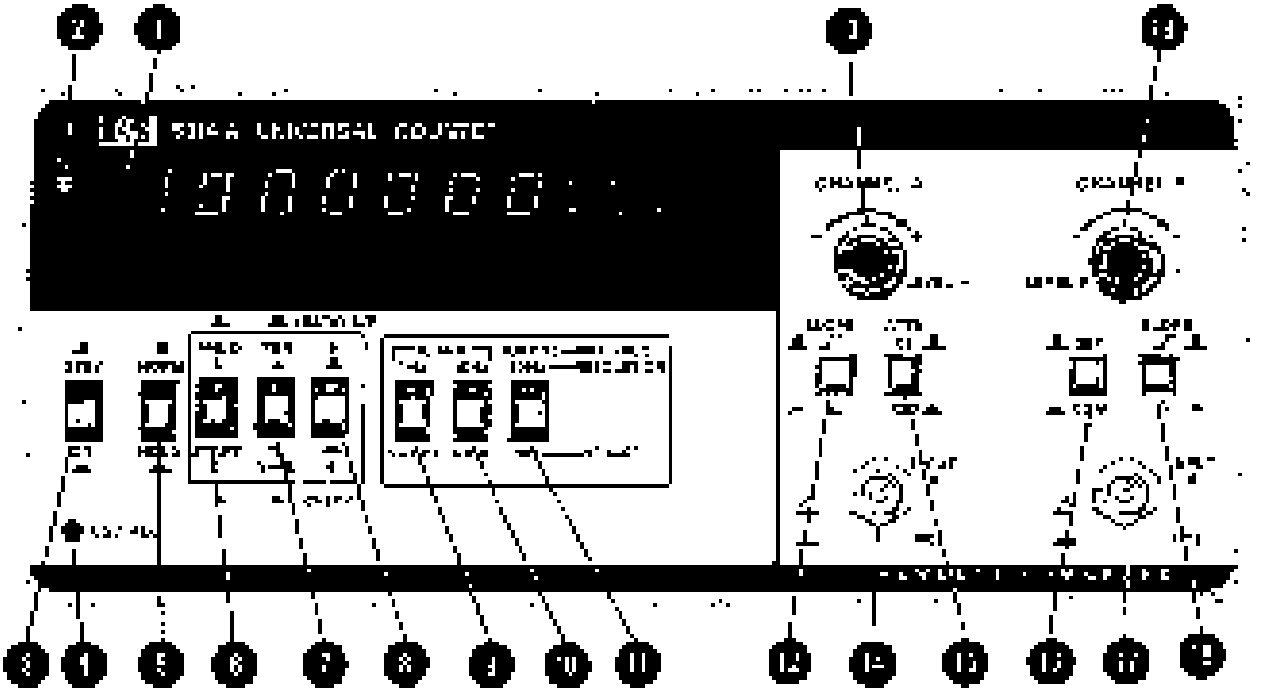
1. Set the POWER (3) to the ON position.
2. Set COM A/SEP switch (15) to SEP position.
3. Connect the input signal to INPUT A jack (14).
4. Press FREQ A/START A switch (6) IN. Be sure the blue shift key (4) is in the OUT position. This selects the top function of switch (6).
5. Set SLOPE (12), ATTN (13), and LEVEL A (2) to desired positions; see Table 1-1, Specifications for details.
6. Select either 1 Hz (9) or 10 Hz (10) resolution for frequencies between 10 Hz and 10 MHz. NOTE: 10 Hz (10) may also be used. For frequencies higher than 10 MHz, the 100 MHz/10 Hz switch (11) must be pressed IN.

NOTE

The following three resolutions are available with the HP 5314A but are not printed on the front panel.

A. For 0.1 Hz resolution (10 second gate time) on frequencies from 10 Hz to 10 MHz, place all three resolution switches (9) (10) (11) in the OUT position.
B. For 100 Hz resolution (0.01 second gate time) on frequencies to 100 MHz, place switches (9) and (11) in the IN position.
C. For 1 kHz resolution (0.001 second gate time) on frequencies to 100 MHz, place switches (9) and (10) in the IN position.

Figure 3-3. Frequency Measurement Setup

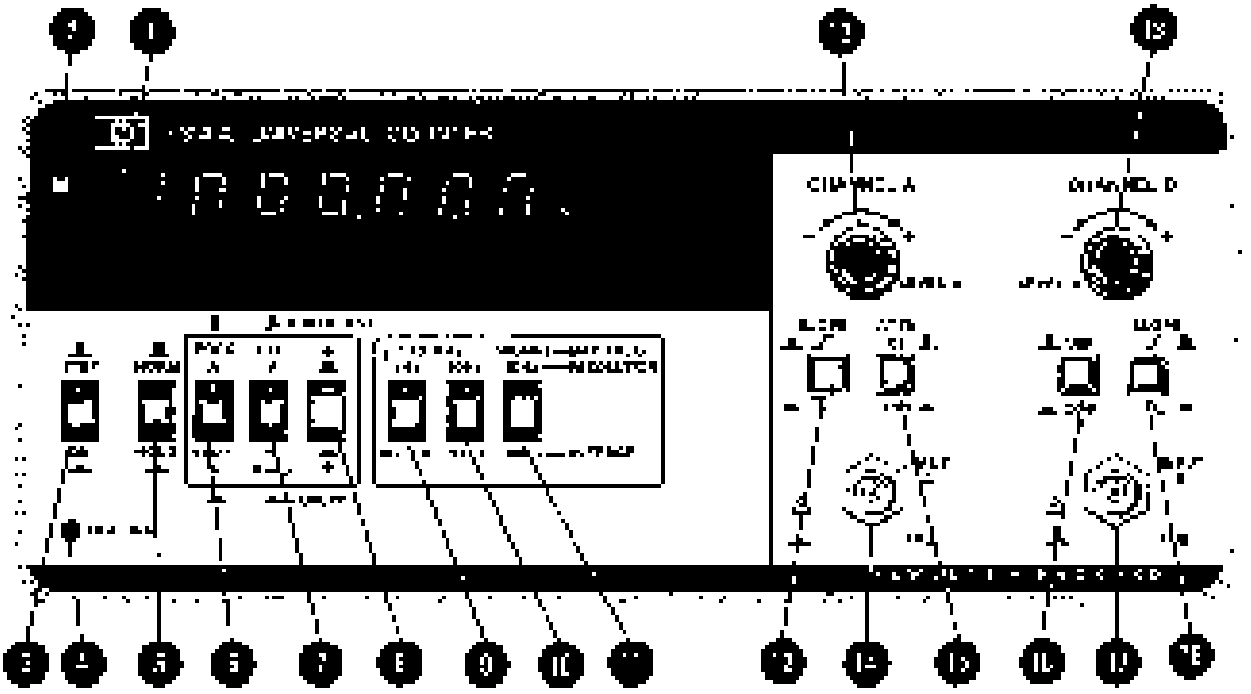


NOTE

See Table 1-1 for the specifications of all input signals concerning bandwidth, accuracy and amplitude.

1. Set line switch ⑨ to the ON position.
2. Set COM A/SEP switch ⑬ to SEP position.
3. Connect the input signal to INPUT A jack ⑭.
4. Press PER A/FR A–B switch ① IN. Make sure the 3 push buttons ⑧ are in the OUT position. This selects the top function of switch ①.
5. Set slope ⑫, ATTN ⑩ and LEVEL ⑪ to desired positions (see Table 1-1, Specifications, for details).
6. Press desired sample size switch ④, ⑤, ⑥, ⑦. For an explanation of the sample size switches ④ ⑤ and ⑥, see Figure 3-2.

Figure 3-1. Period Measurement Setup

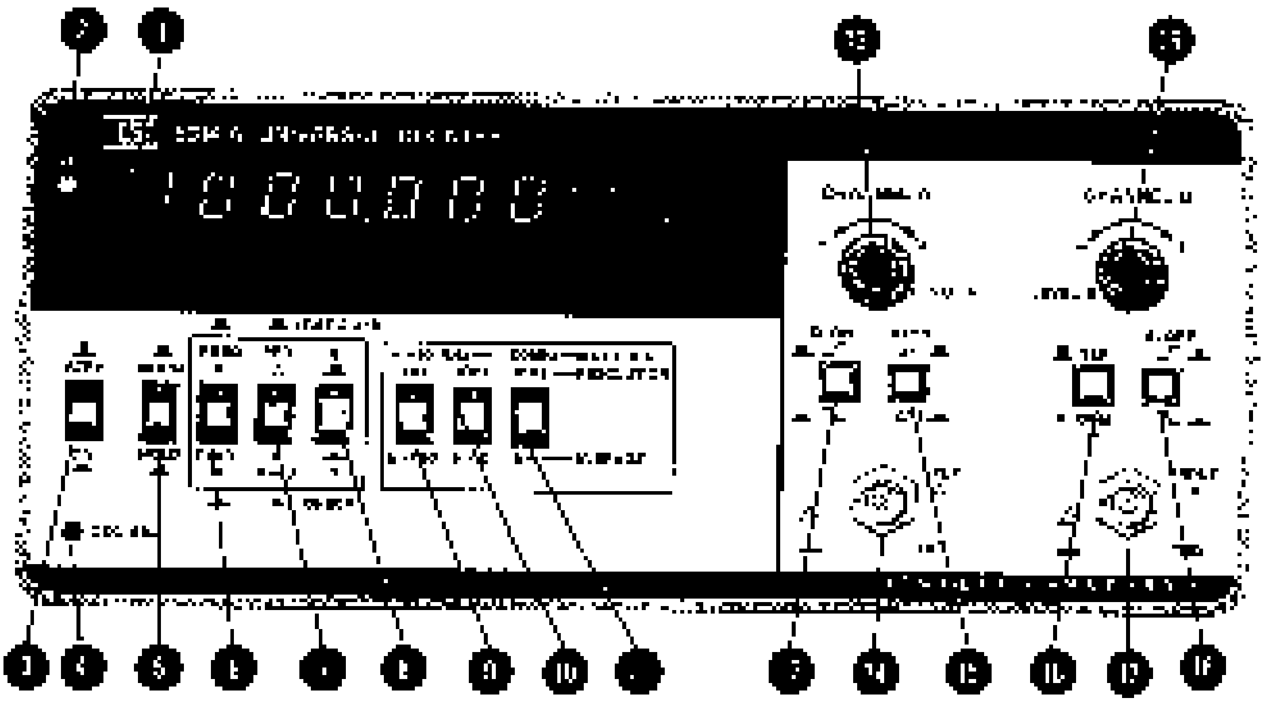


NOTE

See Table 1-1 for the specifications of A1 input signals accepting bandwidth, accuracy, and amplitude. See paragraph 3-11 for time interval analog character only.

1. ES line switch ⑨ to the ON position.
2. Set COM A/SEP switch ⑭ to COM A position.
3. Connect the input signal to the INPUT A jack ⑮.
4. Press PER A/T.I. A→B switch ⑦ IN. Press the blue shift key ⑤ IN position. This selects the period function of switch ⑦.
5. Set SLOPE switches ⑩ and ⑫. A TI switch ⑰ and LEVEL A and B controls ⑱ and ⑲ to desired positions. See table 3-1, Specifications, for details.
6. Press measure/arm switch ⑧ (MEAS IN). This places the HP 5314A into single-shot mode. A time interval measurement made with the HP 5314A should be single-shot.

Figure 3-5. Time Interval Measurement Setup

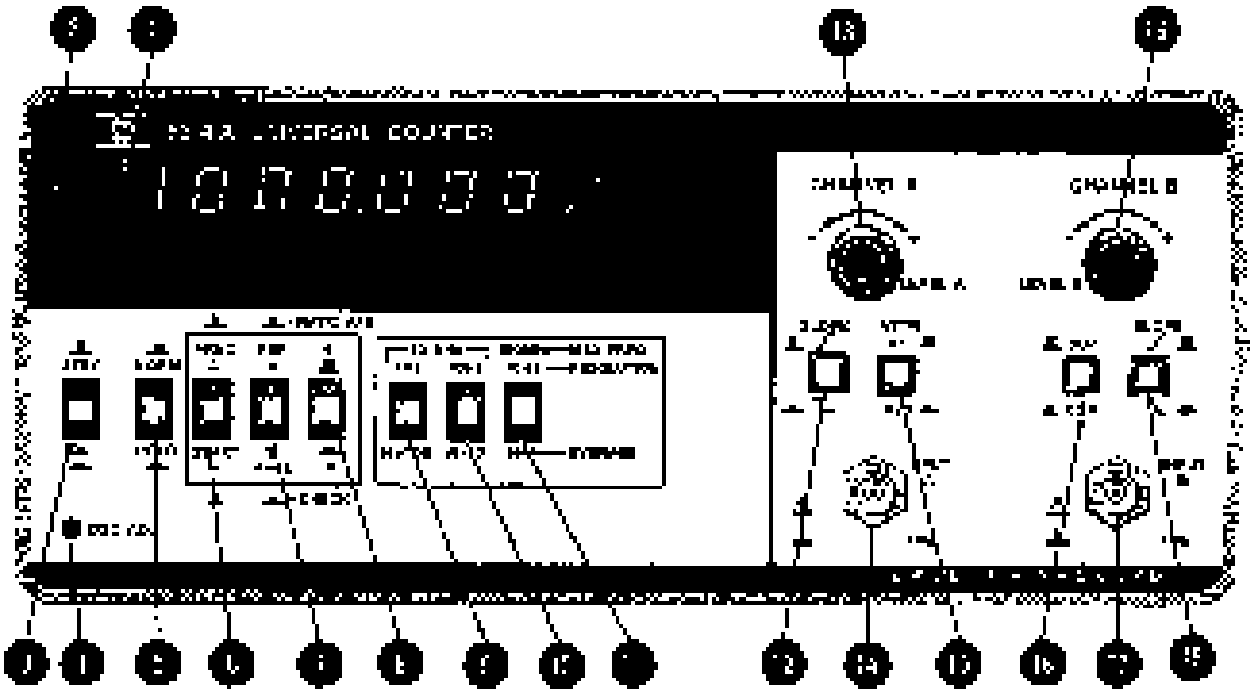


NOTE

See table 1-2 for specifications on all input signals concerning bandwidth, accuracy, and amplitude. See paragraph 3-14 for time interval arming characteristics.

1. Set LINE switch (3) to the ON position.
2. Set COM A/SEP switch (4) to SEP position.
3. Press PER A/T.I. A→B switch (7) IN. Press the Blue (SHIFT) key (1) ON position. This selects the bottom function of switch (7).
4. Connect the start time interval signal to the INPUT A jack (14). Connect the stop time interval signal to the INPUT B jack [illegible].
5. Set SLOPE switches (12) and (16), ATTN switch (15), and LEVEL A and B controls (18) and (19) to desired positions; see table 1-2, Specifications, for details.
6. Press resolution switch (11) (N=1) IN. This places the HP 5314A into single shot mode. All time interval measurements made with the HP 5314A should be single shot.

Figure 3-5. Two Source Time Interval Measurement Setup

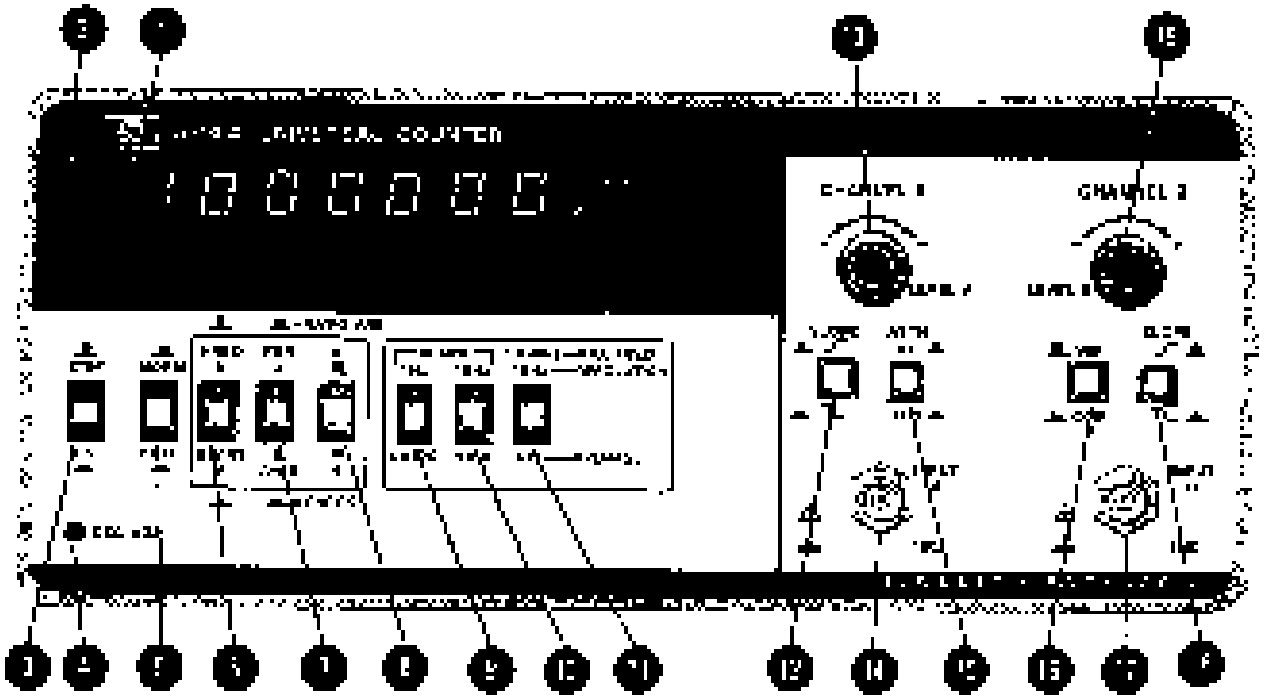


NOTE

See Table 3-1 for specifications and information concerning bandwidth, accuracy, and amplitude.

1. Set line switch ⑦ to the ON position.
2. Set COM A/SEP switch ⑱ to SEP position.
3. Place the two function switches ① and ② in the D-T position. This places the HP5314A in the Ratio A to B function.
4. Connect the higher freq. sine signal to the INPUT A jack ⑭. Connect the lower frequency signal to the INPUT B jack ⑮ (the higher frequency can be input to INPUT B if it is below 25 MHz).
5. Set SLOPE switches ⑫ and ⑬, ATTN switch ⑨, and LEVEL A and B controls ⑪ and ⑩ to desired positions; see Table 3-1, Specifications, for details.
6. Press the desired sample rate switch ③, ④, or ⑤. For an explanation of the sample rate switches, see *Figure 3-7*, ①, ④, and ⑦.

Figure 3-7. Ratio Measurement Setup

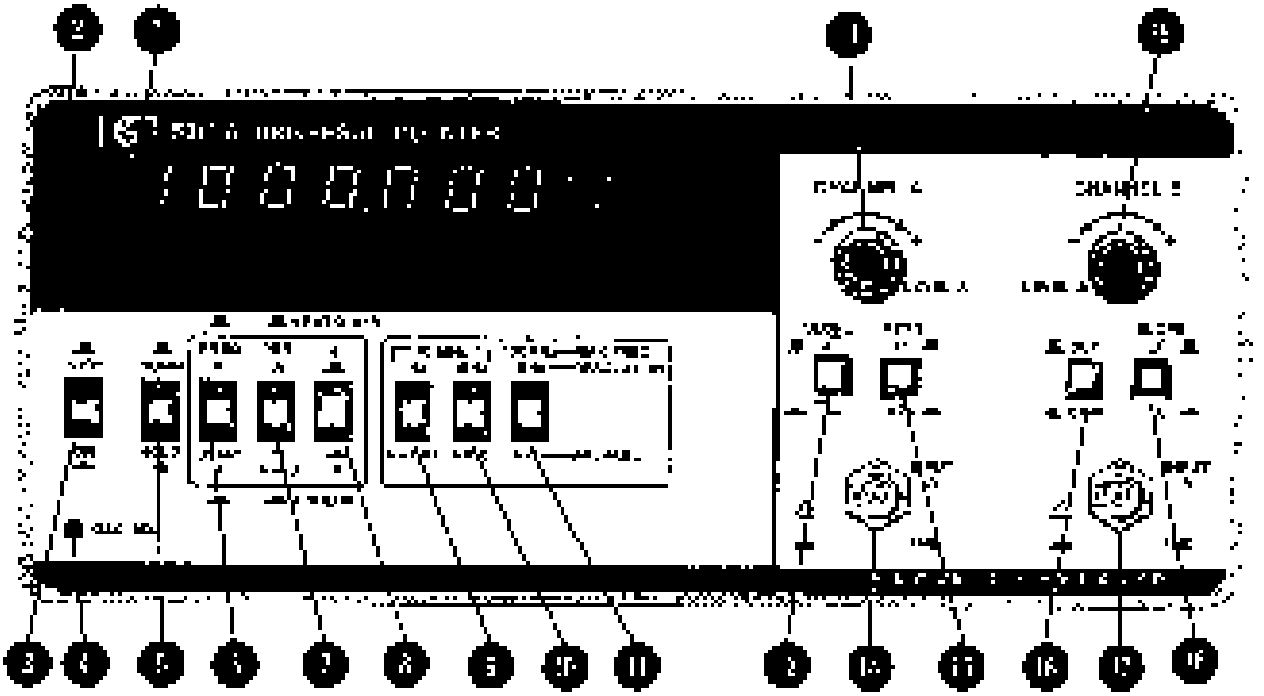


NOTE

See Table 3-1 for specifications on gating, crystal oscillator, bandwidth, accuracy, and amplitude.

1. Set line switch ⑨ to the ON position.
2. Set COM A/SEP switch ⑬ to SEP position.
3. Press the FREQ A/START A switch ⑧ IN.
4. Press the blue shift key ⑦ (its position) THIS selects the bottom function of switch ⑧.
5. Set SLOPE ⑨, ATTN ⑩, and LEVEL A ⑪ to desired position; see Table 3-1 Operations for details.
6. Connect the input signal to INPUT A jack ⑯. For input frequencies higher than 70 MHz, the 100 MHz/10 Hz resolution switch ⑰ prescale by 10, MUST be pressed IN position.

Figure 3-3. Positive Measurement Setup



NOTE

This operator's check checks for proper operation of the counter chip A1U2, the function and resolution switches, and the display. This procedure does not check the operation of the two input amplifiers. See Figure 4-7, Operation Verification, for a more complete operational check.

1. Set the Line switch (3) to the ON position.
2. Depress both function switches (1) and (2) (IN position). This places the HP 5314A in the self-check mode.
3. Place resolution switch (9) (1 Hz/N=100) in the IN position. The HP 5314A should display

   8888.888

   with the overflow LED (5) ON and the instrument gating once every second.
4. Place resolution switch (10) (10 Hz/N=10) in the IN position. The HP 5314A should display

   1888.88

   with the overflow LED OFF and a 100-millisecond gate time.
5. Place resolution switch (7) (100 Hz/N=1) in the IN position. The HP 5314A should display

   188.88

   with the overflow LED (5) ON and a 1-second gate time.
6. Place both resolution switches (9) and (8) in the IN position. The HP 5314A should display

   18888.8

   with the overflow LED (5) OFF and a 100-millisecond gate time.
7. Place both resolution switches (11) and (10) in the IN position. The HP 5314A should display

   18888.

   with a 10-millisecond gate time.

Figure 3-3. Operator's Check

SECTION IV
PERFORMANCE TESTS

4-1. INTRODUCTION

4-2. The two procedures in this section test the instrument's electrical performance using the specifications of Table 1-1 as performance standards. The first test is an operation verification which checks all major functions of the HP 5314A. The second test is the full performance test which checks all specifications.

4-3. EQUIPMENT REQUIRED

4-4. Equipment required for the complete test and operation verification is listed in Table 1-2. Any equipment which satisfies the critical specifications given in the table may be substituted for the recommended model.

4-5. OPERATION VERIFICATION

4-6. The abbreviated checks given in Table 4-1 can be performed to give a high degree of confidence that the HP 5314A is operating properly without performing the complete performance test. The operation verification should be used for incoming QA, routine maintenance, and after instrument repair.

4-7. PERFORMANCE TEST

4-8. The performance test is given in Table 4-2. The performance test verifies all specifications listed in Table 1-1. Depending on the use and environmental conditions, the instrument should be checked using the performance test at least once a year.

4-9. TEST RECORD

4-10. Results of the operation verification may be tabulated on the operation verification test card located at the end of Table 4-1. Results of the performance tests may be tabulated on the performance check test card located at the end of Table 4-2.

Table 4-1. Operation Verification

I. SELF TEST

Perform the self test procedure per Figure 3-9. Mark the results on the test card.

II. FREQUENCY RESPONSE AND SENSITIVITY

A. CHANNEL A

Specification: 10 Hz—100 MHz, 25 mV rms

1. Set the HP 5314A front panel controls as follows:

FUNCTION	FREQ A
RESOLUTION	1 Hz
BOTH SLOPES	[illegible]
BOTH LEVELS	Midrange
ATTN	X1
SEP/COM A	SEP

2. Connect an HP [illegible] oscillator to the HP 5314A INPUT A with a cable and 50-ohm feed-through. Set the HP [illegible] for 500 Hz and 5 MHz at 25 mV rms (70 mV p-p). Replace the HP [illegible] with an HP 8656A signal generator. Press resolution switch 10 Hz [illegible]. Set the HP 8656A for 50 MHz and 100 MHz at 25 mV rms (70 mV p-p). The counter should display the specified frequencies. Mark the results on the test card.

Table 4-1. Operation Verification (Continued)

B. CHANNEL B

Specification: 10 Hz—2.5 MHz, 25 mV rms

1. Repeat step A1. Set the HP 5314A SEP/COM A switch to COM A, set function switches FREQ A and PER A OUT.
2. Connect an HP 3314A to the HP 5314A INPUT A with a cable and 50-ohm feedthrough. Set the HP 3314A for 10 Hz and 2.5 MHz at 25 mV rms (~70 mV p-p). The HP 5314A should display "1.00" at both specified frequencies. Mark the results on the test card.

III. PERIOD

Specification: 10 Hz—2.5 MHz, 25 mV rms

A. Repeat Test II, Step A1. Set the HP 5314A function switch PER A IN (make sure the HP 5314A blue key is OUT).

B. Connect an HP 3314A to the HP 5314A INPUT A with a cable and 50 ohm feedthrough. Set the HP 3314A for 500 Hz and 2.5 MHz at 25 mV rms (~70 mV p-p). The HP 5314A should display 2 milliseconds and 0.400 microseconds, respectively. Mark the results on the test card.

IV. TIME INTERVAL

Specification: 250 ns—1 s, 25 mV rms

A. Set the HP 5314A front panel controls as follows:

FUNCTION	TI A→B
RESOLUTION	N=1
Blue key	[illegible]
CHANNEL A SLOPE	_/‾
ATTN	X1
SEP/COM A	COM A
CHANNEL B SLOPE	‾_
BOTH LEVELS	midrange

B. Connect an HP 3314A to the HP 5314A INPUT A with a cable and 50-ohm feedthrough. Set the HP 3314A for 1 MHz at 100 mV rms (~280 mV p-p). The HP 5314A should display 0.5 microseconds ±100 nanoseconds. Mark the results on the test card.

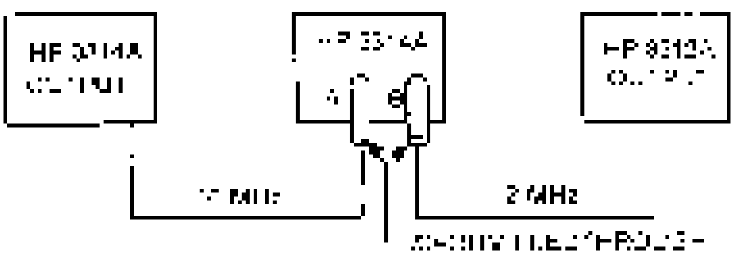
V. RATIO

Specifications:
Channel A: 10 Hz—10 MHz, 25 mV rms
Channel B: 10 Hz—2.5 MHz, 25 mV rms

A. Set the HP 5314A front panel controls as follows:

FUNCTION	RATIO A/B
RESOLUTION	N=100
BOTH SLOPES	[illegible]
BOTH LEVELS	Midrange
ATTN	X1
SEP/COM A	SEP

B. Connect the HP 5314A, HP 3314A, and HP 3312A as shown in the following diagram:



Ratio Test Setup

C. Set the HP 3314A for 10 MHz at 25 mV rms. Set the HP 3312A function generator for 2 MHz at 25 mV rms square wave. The HP 5314A should display 5.000. Mark the results on the test card.

OPERATION VERIFICATION TEST CARD

Table 4-2. A-Calcium Performance Test

I. SELF TEST

Perform the self test procedure per figure 3-1. Mark the results on the test card.

II. FREQUENCY RESPONSE AND SENSITIVITY

A. CHANNEL A

Specification: 10 Hz—100 MHz, 25 mV rms

1. Set the HP 5314A front panel controls as follows:

FUNCTION ..... FREQ A
RESOLUTION ..... 1 Hz
BOTH SLOPES ..... ⎍
ATTN X1
SEP/COM'A ..... SEP
BOTH LEVELS ..... Midrange

2. Connect the HP 3314A to the HP 5314A INPUT A with a cable and 50-ohm feedthrough. Vary the HP 3314A from 10 Hz to 100 MHz, maintaining 25 mV rms signal level. The counter should display the correct frequencies. Mark the results on the test card.

3. Connect an HP 8656A signal generator to the HP 5314A INPUT A with a cable and 50-ohm feedthrough. Press the preset and 10 MHz front panel buttons. Vary the HP 8656A signal generator from 10 MHz to 100 MHz, maintaining 25 mV rms signal level. The counter should display the correct frequencies. Mark the results on the test card.

B. CHANNEL B

Specification: 10 Hz—3.5 MHz, 25 mV rms

1. Repeat steps A1—5 for the HP 5314A. SEP/COM'A switch in COM'A. Set all three function switches OUT.

2. Connect the HP 3314A to the HP 5314A INPUT A with a cable and a 50-ohm feedthrough. Vary the HP 3314A from 10 Hz to 3.5 MHz, maintaining 25 mV rms signal level. The counter should display "100" throughout the specified frequencies. Mark the results on the test card.

III. PERIOD

Specification: 10 Hz—3.5 MHz, 25 mV rms

A. Repeat Test II, Step A1. Set the HP 5314A function switch PER A to FREQ A switch OUT. Make sure the HP 5314A blue key is OUT.

2. Connect the HP 3314A to the HP 5314A INPUT A with a cable and 50-ohm feedthrough. Vary the HP 3314A from 10 Hz to 3.5 MHz, maintaining 25 mV rms signal level. The counter should display the correct period of the frequencies. Mark the results on the test card.

IV. TIME INTERVAL

Specification: 250 ns—1 s, 25 mV rms

A. Set the HP 5314A front panel controls as follows:

FUNCTION ..... TI A to B
BLUE key ..... IN
RESOLUTION X1
CHANNEL A SLOPE ..... ⎍
CHANNEL B SLOPE ..... ⎍
ATTN X1
SEP/COM'A ..... COM'A
BOTH LEVELS ..... Midrange

B. Connect an HP 3314A to the HP 5314A INPUT A with a cable and 50-ohm feedthrough. Set the HP 3314A for 1 MHz at 100 mV rms (-315 mV p-p). The HP 5314A should display 1 μs or any number 1000 nanoseconds. Mark the results on the test card.

Table 4-2. In-Cabinet Performance Test (Continued)

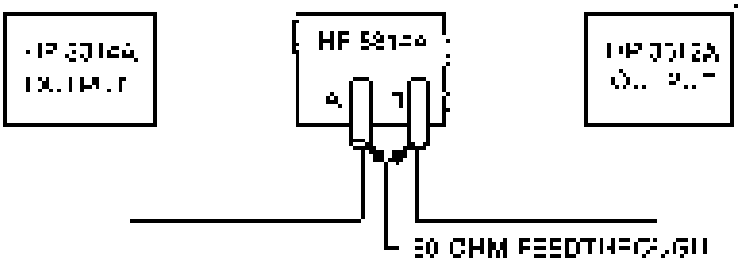
V. RATIO

Specifications:
Channel A: 10 Hz—10 MHz, 25 mV rms
Channel B: 10 Hz—225 MHz, 25 mV rms

A. Set the HP 5314A front panel controls as follows:

FUNCTION	RATIO A/B
RESOLUTION	1E-7
BOTH SLOPES	
BOTH LEVELS	Midrange
ATTN	1:1
SEP/COM A	SEP

B. Connect the HP 5314A, HP 8614A, and HP 3312A as shown in the following diagram:



C. Set the HP 8614A for 10 MHz at 25 mV rms. Set the HP 3312A function generator for 2 MHz at 25 mV rms output level. The HP 5314A should display 5.0E-7 with some multi on the last card.

VI. TOTALIZE

Specifications: 10 Hz—10 MHz, 25 mV rms

A. Set the HP 5314A front panel controls as follows:

RESET/HOLD	NORM
FUNCTION	START A
BLUE key	IN
RESOLUTION	7
BOTH SLOPES	
ATTN	1:1
SEP/COM A	SEP
BOTH LEVELS	Midrange

B. Set the HP 3312A for 10 MHz at 25 mV rms. Connect the HP 8614A to the HP 5314A INPUT A with a cable and 50 ohm feedthrough. Observe the HP 5314A display accumulating at 10 MHz rate. Press the NORM/HOLD switch IN. Notice the display stops accumulating. Release the NORM/HOLD switch (OUT position). Notice the update cycle and resume accumulating. Set the HP 3312A for 10 MHz at 25 mV rms. The HP 5314A display should be counting with the OVFL indicator to meet the requirements of test card.

SECTION V
ADJUSTMENTS

5-1. INTRODUCTION

5-2. This section describes the two adjustments that may be made to the HP 5314A. First, the power transformer primary is switchable to allow selection of two different nominal line voltages and second, the time base oscillator frequency is adjustable. The HP 5314A top cover must be removed to change the power transformer primary line voltage range as directed in Table 5-1. The time base oscillator frequency may be adjusted via an adjustment which can be set in the lower left-hand corner of the front panel. Two methods for adjusting the time base frequency are given in Table 5-2. The first method uses an external input with the HP 5314A in frequency mode. The second method compares using an oscilloscope the internal 10 MHz time base with an external house standard.

5-3. Adjustments for Dashes 001 and 002 are described in Tables 5-3 and 5-4, respectively. Table 5-3 describes how to adjust the Temperature Compensated Crystal Oscillator (TCXO) in my assy. Table 5-4 describes how to adjust the automatic battery charger's cutoff voltage. Adjustments for both Dashes 001 and 002 require access to the inside of the HP 5314A.

5-4. EQUIPMENT REQUIRED

5-5. The test equipment required for the adjustment procedures is listed in Table 5-1, Recommended Test Equipment. Substitute equipment may be used if it meets or exceeds the critical specifications.

5-6. ADJUSTMENT LOCATIONS

5-7. Adjustment locations are identified in the component locators in Section VIII and in the top internal view of the HP 5314A as shown in Figure 5-2.

5-8. SAFETY CONSIDERATIONS

5-9. This section contains warnings and cautions that must be followed for your protection and to avoid damage to the equipment.

WARNING

MAINTENANCE DESCRIBED HEREIN IS PERFORMED WITH POWER SUPPLIED TO THE INSTRUMENT, AND PROTECTIVE COVERS REMOVED. SUCH MAINTENANCE SHOULD BE PERFORMED ONLY BY SERVICE-TRAINED PERSONNEL WHO ARE AWARE OF THE HAZARDS INVOLVED (FOR EXAMPLE, FIRE AND ELECTRICAL SHOCK). WHERE MAINTENANCE CAN BE PERFORMED WITHOUT POWER APPLIED, THE POWER SHOULD BE REMOVED.

BEFORE ANY REPAIR IS COMPLETED, ENSURE THAT ALL SAFETY FEATURES ARE INTACT AND FUNCTIONING, AND THAT ALL NECESSARY PARTS ARE CONNECTED TO THEIR PROTECTIVE GROUNDING MEANS.

Table 5-1. Input Line Voltage Adjustment

WARNING!

THE POWER CORD SHOULD BE REMOVED FROM THE REAR OF THE HP 5314A BEFORE STARTING THIS ADJUSTMENT PROCEDURE.

1. Turn the HP 5314A upside down and remove the four screws near the corners of the cabinet bottom.
2. Holding the top and bottom covers together, turn the HP 5314A right-side up and carefully lift the top cover. This accesses the line voltage selector switch located on the A2 (5311-60001) power supply assembly (large pc assembly located in the rear of the cabinet).
3. The switch section will now be properly set to match the input voltage (115 for 90Vac to 126Vac input or 230 for 198Vac to 252Vac input).
4. Replace the top cover and carefully turn the unit upside down. Replace and tighten the four screws, one in each corner, of the cabinet bottom.

NOTE

The line voltage selector switch automatically selects the current line input fuse configuration. (The two fuses are located on the A2 assembly and are in series for 230V operation and in parallel for 115V operation).

Table 5-2. Time Base Frequency Adjustment

NOTE

If this adjustment is to be considered valid, the HP 5314A must have a 24 hour warm-up and the line voltage must be within −5% to +10%.

METHOD #1

1. Apply an external signal of known frequency (e.g., 10MHz) and suitable amplitude (minimum 2 volts rms) to the Channel A input of the HP 5314A.
2. Set the HP 5314A front panel controls as follows:

ON/OFF	ON
NORM/MONITOR	NORM
FUNCTION	FREQ A
TIME key	OUT
RESOLUTION	1 Hz
CHANNEL A	
LEVEL A	CW marker position
SLOPE	+ (OUT)
ATTN	X1
CHANNEL B	
LEVEL B	CW marker position
SLOPE	+ (OUT)
SEP/COM A	SEP

The approximate input frequency should be in the display with an update rate of 1 second.

3. Remove the CAL ADJ window in the lower left-hand corner of the front panel. Insert a plastic tuning wand through the window and turn the adjustment CW (clockwise) until the display shows the input frequency. The internal time base frequency is now correctly adjusted.

Table 5-2. Time Base Adjustment (Continued)

METHOD #2

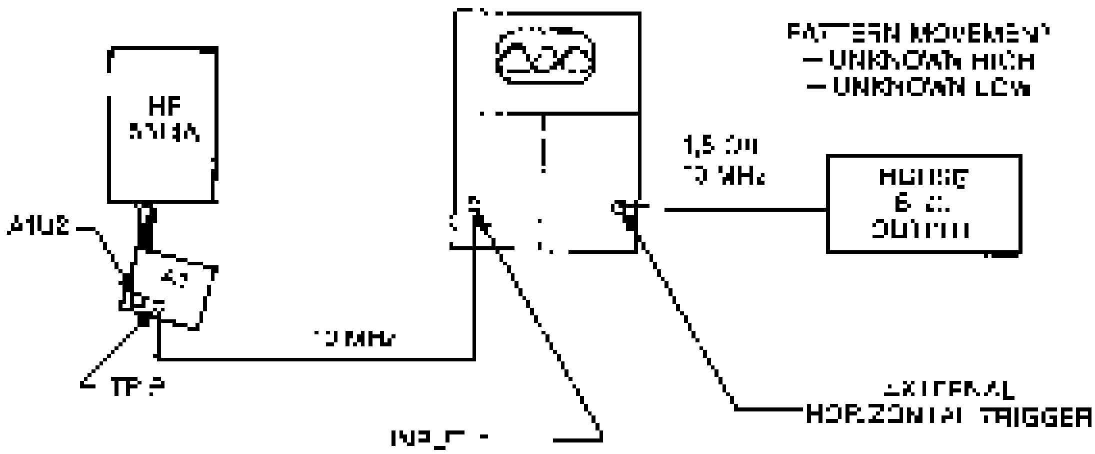
The second method requires access to the inside of the HP 5334A. However, it accomplishes a more accurate adjustment of the time base frequency than Method #1.

NOTE

The power cord should be removed while performing the first four steps.

1. Turn the HP 5334A upside down and remove the four screws near the corners of the cabinet bottom.
2. Holding the top and bottom covers together, turn the HP 5334A right-side up and carefully lift the top cover.
3. Carefully grasp the combination front panel and A1 board assembly and lift until it clears the grooves.
4. Swing the right side of the assembly (while looking toward the rear of the unit) away from the cabinet (toward you). Press the power switch to turn on the HP 5334A.
5. Install the line cord and the HP 5334A should come on (the unit will be on already if it contains the optional battery pack and the battery is charged).
6. Connect an oscilloscope to TP P on the A1 assembly (test point located near pin 41 of U2). This is the buffered 10 MHz internal oscillator.
7. Connect a house-standard signal to the EXT trigger input of an oscilloscope. Refer to the diagram below.

   Every few months the oscillator should be checked to a house standard. When adjustment is required, use the oscilloscope method shown below. Using the appropriate sweep speed, adjust the oscillator until the movement of the pattern is stopped.



Oscillator Adjustment Interconnections

8. Set the controls of the oscilloscope as follows:

COUPLING	AC
INPUT IMPEDANCE	[illegible]
HORIZONTAL TRIGGER	EXT
TIME BASE	0.1 μs/div.

9. Adjust the vertical gain for a full screen waveform. The waveform should be moving either to the left or to the right.
10. Adjust A1C2 (variable capacitor located in the lower left hand corner of the A1 assembly) until the waveform is stationary. The accuracy of the frequency adjustment can be determined by referring to the table at the top of the next page.

Table 3-2. Time Base Adjustment (Continued)

Movement	SWEEP SPEED			NOTES
	1 s/cm	0.1 ms/cm	0.01 µs/cm	
1 cm/s 1 mm/10 s 1 cm/100 s	1×10^{-6} 1×10^{-7} 1×10^{-8}	1×10^{-7} 1×10^{-8} 1×10^{-9}	1×10^{-9} 1×10^{-9} 1×10^{-10}	TIME SCOPE TRACE MOVEMENT WITH SECOND HAND OF WATCH OR CLOCK

The time base frequency adjustment is now complete. Mount the complete front panel/A1 assembly back into the cabinet bottom. Making sure the cables are properly routed, replace the top cover. Turn the HP 5314A upside down, install and tighten the four screws, one in each corner, in the cabinet bottom.

Table 3-3. Option 020 Adjustment

NOTE

If this adjustment is to be used as valid, the HP 5314A must have a half-hour warm-up and the ambient must be within ±5°C to ±10°C of nominal.

There are two methods of adjustment. The preliminary instructions apply to both methods and must be performed regardless of which method is chosen. The first method uses a reference standard signal source to drive channel A input with the HP 5314A making a frequency measurement. The alternate method compares a reference standard signal with the HP 5314A internal time base using an oscilloscope.

PRELIMINARY

1. Remove the power cord from the rear of the HP 5314A.
2. Turn the HP 5314A upside down and remove the four screws near the corners of the cabinet bottom.
3. Holding the top and bottom covers together, turn the HP 5314A right-side up and carefully lift the top cover.
4. Install the Extender Board.

METHOD #1

1. Apply an external reference standard signal (minimum 25 mV rms) to the Channel A input of the HP 5314A.
2. Set the HP 5314A front panel controls as follows:

POWER	ON
MEASUREMENTS	NORM
FUNCTION	FREQ A
RESOLUTION	1 Hz
CHANNEL A	
LEVEL A	(For center position)
SLOPE	+ (LED)
ATTN	X1
CHANNEL B	
LEVEL B	(For center position)
SLOPE	+ (LED)
SEP/COM A	SEP

The approximate input frequency should be displayed with an update once a second.

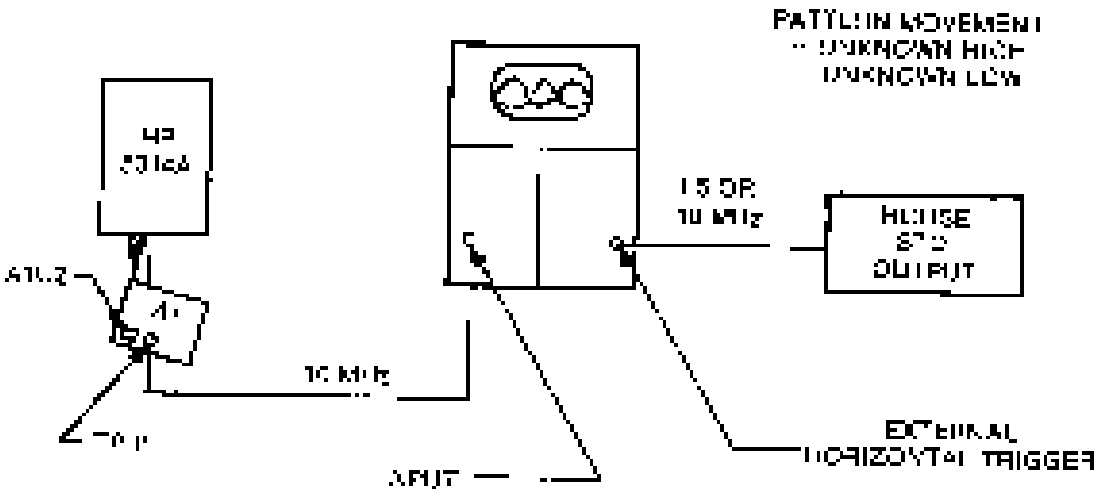
Table 5-3. Option 001 Adjustments (Continued)

The time base frequency is now properly adjusted. Replace the top cover and turn the HP 5314A upside down. Replace and tighten the four screws in the cabinet bottom.

METHOD #2

1. Carefully grasp the combination front panel and A1 board assembly and lift until it clears the grooves.
2. Swing the right-side of the assembly away from the cabinet.
3. Press the power switch to turn the instrument ON.
4. Connect an oscilloscope to TP 8 of the A1 assembly (test point located near pin 4 of IC U21). This is the buffered 10 MHz time base.
5. Connect a minus-ramp signal to the EXT trigger input of the oscilloscope. Refer to the diagram below.

   Every few months the oscillator should be checked to house standard. When adjustment is required, use the oscilloscope method below. Using the appropriate sweep speed, adjust the oscillator until the movement of the pattern is stopped.



Oscillator Adjustment Interconnections

6. Set the controls of the oscilloscope as follows:

   COUPLING ..... AC
   INPUT IMPEDANCE ..... 1 Meg
   HORIZONTAL TRIGGER ..... EXT
   TIME BASE ..... 0.1 μs/div.

7. Adjust the vertical gain for a full screen waveform. The waveform should be moving either to the left or to the right.
8. Locate the A1 assembly TCXO which is mounted on the A2 power supply assembly. The frequency adjustment is a screw-type adjustor located on the top of the TCXO. Using a plastic tuning wand, adjust the TCXO frequency until the correct reading (the exact frequency of the input house-standard) is on the HP 5314A display.

Table 3-3. Option 001 Adjustment (Continued)

Measurement	SWEEP SPEED			NOTES
	1 μsec/cm	0.1 μs/cm	40ns μs/cm	
1 cm/div	1 x 10^-6	1 x 10^-7	1 x 10^-8	TIME SCOPE TRACE MOVEMENT WITH SECOND HAND OR WATCH OR CLOCK
1 cm/div	1 x 10^-5	1 x 10^-6	1 x 10^-7	
1 cm/div	1 x 10^-4	1 x 10^-5	1 x 10^-6	

The time base frequency adjustment is now complete. Mount the combination front panel/A1 assembly back into the cabinet bottom. Make sure the cables are properly routed, replace the top cover. Turn the HP 5314A upside down. Install and tighten the four screws, one in each corner, in the cabinet bottom.

Table 3-4. Option 002 Charger Cutoff Voltage Adjustment

This adjustment set the voltage at which the 0.5 amp charging current to the battery is terminated. It is preset at the factory and normally requires no further adjustment. However, readjustment is necessary after a repair to the A1 assembly or after field installation of Option 002.

1. Remove the power cord from the rear of the HP 5314A.
2. Turn the HP 5314A upside down and remove the four screws near the corners of the cabinet bottom.
3. Pulling the top and bottom covers together, turn the HP 5314A right side up and carefully lift the top cover.
4. Disconnect the red and black cables from the battery.
5. Insert the line cord and turn the HP 5314A ON.
6. Connect a low voltage power supply to the A1 assembly between cable position J and red cable and negative (-) to black cable.
7. Turn the pot on the A3 assembly (A3R12) fully clockwise.
8. Adjust the power supply voltage, now increased to 16.5 volts ±5 millivolts.
9. Connect a voltmeter between ground and A3E10.
10. Turn the pot (A3R12) counterclockwise slowly until the voltage rises above 3 volts (typically 3-4 volts).
11. Disconnect the low voltage power supply from the red and black cables.
12. Turn the HP 5314A to STBY and disconnect the line cord.
13. Connect the red and black charger cable to the positive and negative posts of the battery, respectively.
14. Replace the handle and top cover.
15. Turn the unit upside down, install and tighten the four screws (one in each corner) of the cabinet bottom.

Adjustment of the A3 assembly is now complete.

SECTION VI
REPLACEABLE PARTS

6-1. INTRODUCTION

6-2. This chapter contains information for ordering parts. The following replaceable parts lists are included.

Table 6-1	Reference Designations and Abbreviations
Table 6-2	Replaceable Parts
Table 6-3	Manufacturer's Codes

6-3. REFERENCE DESIGNATIONS

6-4. Table 6-1 lists the abbreviations and reference designations used in the parts lists, block diagrams, and throughout the manual.

6-5. REPLACEABLE PARTS

6-6. Table 6-2 is the list of replaceable parts and is organized as follows:

1. Electrical assemblies in alphanumerical order by reference designation.
2. Chassis-mounted electrical parts in alphanumerical order by reference designation.
3. Chassis-mounted mechanical parts in alphanumerical order by reference designation.

6-7. The information given for each part consists of the following:

1. Reference Designation.
2. Hewlett-Packard part number.
3. Part number check digit (CD).
4. Total quantity (QTY) in instrument. The total quantity is given once and at the first appearance of the part number in the list.
5. Description of the part.
6. Typical manufacturer's part number for the part.

6-8. HOW TO ORDER A PART

6-9. Hewlett-Packard wants to keep your parts ordering process as simple and efficient as possible. Think of the process as having the following steps:

- Identifying the part and the quantity that you want.
- Determining the ordering method to be used and contacting Hewlett-Packard.

6-10. Parts Identification

6-11. To identify the parts you want, first refer to the replaceable parts lists (Tables 6-2 and 6-3) in this chapter.

6-12. When ordering from Hewlett-Packard, the important numbers to note from the Parts List are the HP Part Number and numerical two-digit (or three-digit for "CD" Option) and the quantity of the part you want.

6-13. If the part you want is NOT identified in the manual, you can call an Hewlett-Packard for help (see the following section "Contacting Hewlett-Packard"). Please have the following information at hand when you contact HP for help:

- Instrument Model Number (example "HP 5314A")
- Complete Instrument Serial Number (example "1234A00123"). (If you are about where to find the serial number, look over in the preface of this manual in the "HOW TO USE THIS MANUAL" section.
- Description of the part and its use.
- Quantity of the part required.

6-14. Contacting Hewlett-Packard

6-15. Depending on where you are in the world, there are three or more ways in which you can get parts or parts information from Hewlett-Packard.

- Outside the United States, contact your local HP sales office. HP sales offices are listed at the back of this manual.
- Within the United States, we encourage you to order replacement parts or repair parts information directly by telephone or mail from the HP Support Materials Organization. (Using the telephone numbers or address listed below) or you can contact your local HP sales office. (HP sales offices are listed at the back of this manual.)

6-16. By telephone:

a. For Parts Ordering, use our toll free number (800) 227-8164, Monday through Friday (except Holidays), 6 am to 5 pm (Pacific Time).

b. If you need a part in a hurry, an extra cost Hotline ordering service is available. 24 hours a day. Use the toll free number above at the times indicated; at other times, use (415) 856-1347.

c. For Parts Identification Assistance, call (916) 783-8704. Our Parts Identification hours are from Monday through Friday, 8 am to 5 pm (Pacific Time).

6-17. For mail correspondence, use the address below:

Hewlett-Packard
Support Materials Roseville
P.O. Box 1145
Roseville, Ca 95661-1145

6-18. CABINET PARTS AND HARDWARE

6-19. To locate and identify miscellaneous cabinet parts, refer to Figure 6-1. This figure provides an exploded view of the cabinet with the parts identified by reference designation. The reference designations correspond with the ones in Table 6-3.

SECTION VII
MANUAL CHANGES

7-1. INTRODUCTION

7-2. This section contains information for adapting this manual to instruments with serial prefixes other than that listed on the title page. Refer to Section I for additional important information about serial number coverage.

7-3. MANUAL CHANGES

7-4. Newer Instruments

7-5. Instruments having serial numbers prefixes higher than those listed on the title page of this manual are covered with a "Manual Changes" sheet included with this manual. If no change sheet is included, information can be supplied by any Hewlett-Packard Sales and Service Office listed at the back of this manual.

7-6. Older Instruments

7-7. If your instrument's serial number prefix is lower than that listed in this manual, this manual must be modified to correctly apply to your instrument. To determine which changes must be made to this manual, locate your instrument's serial number prefix in Table 7-1 Manual Backdating, then make the indicated changes.

Table 7-1. Manual Backdating

IF YOUR HP 3044A HAS SERIAL PREFIX	THEN MAKE THE FOLLOWING CHANGES TO THIS MANUAL
2816A	2
2936A & Instrument Serial Numbers 2936A12297 & above	1
2936A	1 through 4
2936A & Instrument Serial Numbers 2936A07397 & above	1 through 5
3026A & Instrument Serial Numbers 3026A02721 & above	1 through 6
3026A	1 through 7
3026A	1 through 8
3026A	1 through 9
3026A	1 through 10
Instrument Serial Numbers 1834A00701 through 1834A00844	1 through 11
1834A	1 through 12
1834A	1 through 13
1834A	1 through 14
1834A	1 through 15

CHANGE 1 Series 2714A

Section 6, Task 6-2, A1 Main Board Assembly Replaceable Parts:
Change A1C01 - C03 from 0160-4822-1 COUPE to 0160-4643 CAPACITOR-FXD 1000PF ±5% 100VDC CER.
Delete A1MP7, CONNECTOR SINGLE CONT.
Delete A1MP4 through MP6, TUBING-FLEX.

CHANGE 2 Series 2904A

Page 6-4/6-5, Table 6-2, A1 Main Board Assembly Replaceable Parts

Change A1C01 - C03 from 0160-4643 to 0160-4822 CAPACITOR-FXD 1000PF ±5% 100VDC CER, 28480, 0160-4822.
Add A1MP4 - MP6, 0360-0824, Qty 3, TUBING-FLEX .031-D TFT .012-WALL, 28480, 0160-4822.
Add A1MP7, 1251-4707, Qty 1, CONNECTOR-SGL CONT PIN .087-IN-BSC-ST, Amphe, 1251-4707

CHANGE 3 Series 2535A

Page 6-7, Table 6-2, A4 Option 001 TCXO Board Replaceable Parts
Delete resistor A4R3.
Page 8-7, Figure 8-13, A3 Battery Charger Assembly, Option 002 A4 TCXO Assy, Option 001.
Delete A4R3.
Replace A4 component location with the component location shown in Figure 7-5

CHANGE 4 Series 2535A & Instrument Serial Numbers 2535A12871 and Above

Page 6-4, Table 6-2, A1 Main Board Assembly Replaceable Parts
Change A1 05314-60005 series to 2535A
Delete A1C31 – C33.
Delete MP1 – MP7.
Page 8-23, Figure 8-8, A1 Counter Assembly Schematic Diagram
Change A1 05314-60005 Schematic Diagram to series 2535A.
Delete C31 – C33.
Change C1 – C30 to C1 – C28 on Reference Designators Table.

CHANGE 5 Series 2535A and Instrument Serial Numbers 2535A07861 and Above

Page 6-4, Table 6-2, A1 Main Board Assembly Replaceable Parts.
Change A1Q9 and A1Q10 to 1853-0011, TRANSISTOR PNP.
Change A1U4 to 1820-1211, IC TTL LSCL GATE OR, QUAD 2 INPUT.

Page 8-24, Part of Figure 8-9, A2 Power Supply Assembly Component Locator
Replace the component locator with the one shown in Figure 7-1.

CHANGE 6 Series 2036A and Instrument Serial Numbers 2036A07721 and Above

Page 6-7, Table 6-2, A1 Option 001 TCXO Board Replaceable Parts
Change A1 05314-60001 to Series 2032A.

SECTION VIII
SERVICE

WARNING

LINE VOLTAGE IS EXPOSED WITHIN THE HP 5314A EVEN WHEN THE POWER SWITCH IS IN THE STBY POSITION. REMOVAL OF THE POWER CORD IS REQUIRED TO FULLY UNPOWER THE INSTRUMENT.

8-1. INTRODUCTION

8-2 This section contains information needed to service the HP Model 5314A. The information includes: theory of operation, troubleshooting, recommended test equipment, schematic diagram notes, safety considerations, fuse replacement, block diagram theory, detailed circuit theory, service aids, block diagrams, component locators, and schematic diagrams.

8-3. THEORY OF OPERATION

8-4 There are two theories of operation. The first is a block theory. That is, an overview of the HP 5314A is presented. The block theory is assembled to follow the block diagram in Figures 8-2 through 8-5. The second is a detailed theory. It describes in detail, the circuit operation of all assemblies, both standard and optional. All reference is made to the schematic diagrams in Figures 8-8 through 8-10.

8-5. TROUBLESHOOTING

8-6. Troubleshooting for the HP 5314A is performed by selectively isolating and verifying the proper operation of the various circuit sections. This is accomplished in an indicated sequence, through a series of five test procedures, keyed to the troubleshooting block diagram in Figure 8-6.

8-7. RECOMMENDED TEST EQUIPMENT

8-8 Test equipment and test equipment accessories required to maintain the HP 5314A are listed in Table 1-3. Equipment other than that listed may be used if it meets the listed critical specifications.

8-9. SCHEMATIC DIAGRAM NOTES

8-10. Figure 8-7 shows the symbols used on the schematic diagrams. Figure 8-1 also shows the method of assigning reference designations, assembly numbers, and subassembly numbers.

8-11. Reference Designations

8-12. Assemblies such as printed circuit boards are assigned numbers in sequence, A1, A2, etc., as shown in Table 8-1. As shown in Figure 8-7, subassemblies within an assembly are given a subordinate A number. For example, rectifier subassembly A1 has the complete designator A2SA1. For individual components, the complete designator is determined by adding the assembly number and subassembly number, if any. For example, CR1 on the rectifier assembly is designated A2SA1CR1.

Table 8-1. Assembly Designations

Reference Designations	Description	HP Part Number
A1	Counter Assembly	05314-60008
A2	Power Supply Assembly	05314-60006
A3	Battery Charger Assembly (Option 001)	05314-60003
A4	TCXO Assembly (Option 001)	05314-60004

8-13. Identification Markings on Printed Circuit Boards

8-14. HP printed circuit boards (see figure 8-1) have four identification numbers; an assembly part number, a series number, a revision letter, and a production code. The assembly part number has 10 digits (such as 05314-60005) and is the primary identification. All assemblies with the same part number are interchangeable. When a production change is made on an assembly that makes it incompatible with previous assemblies, a change in part number is required. The series number (such as 1616A) is used to document minor electrical changes. As changes are made, the series number is incremented. When replacement boards are ordered, you may receive a replacement with a different series number. If there is a difference between the series number marked on the board and the schematic in this manual, a minor electrical difference exists. If the number on the printed circuit board is lower than that on the schematic, refer to Section VII for backdating information. If it is higher, refer to the yellow-bordered manual change sheets for this manual. If the manual change sheets are missing, contact your local HP Sales and Service Office. See the listing on the back cover of this manual.

8-15. Revision letters (A, B, etc.) denote changes in printed circuit layout. For example, if a capacitor type is changed (a certain value may remain the same) and requires different spacing for its leads, the printed circuit board layout is changed and the revision letter is incremented to the next letter. When a revision letter changes, the series number is also usually changed. The production code is the four-digit, week-segment number used for production purposes.

8-16. SAFETY CONSIDERATIONS

8-17. Although the HP 5314A has been designed in accordance with international safety standards, this manual contains information, cautions, and warnings which must be followed to ensure safe operation and to retain the HP 5314A in safe operating condition (also see Section II, III, V). Service and adjustments should be performed only by qualified service personnel.

WARNING

ANY INTERRUPTION OF THE PROTECTIVE (GROUNDING) CONDUCTOR (INSIDE OR OUTSIDE THE UNIT) OR DISCONNECTION OF THE PROTECTIVE EARTH TERMINAL IS LIKELY TO MAKE THE UNIT DANGEROUS.

8-18. Any adjustment, maintenance, and repair of the opened HP 5314A under voltage should be avoided as much as possible, and when inevitable, should be carried out only by a skilled person who is aware of the hazard involved. Capacitors inside the HP 5314A may still be charged even if the unit has been disconnected from its source of power.

WARNING

LINE VOLTAGE IS EXPOSED WITHIN THE HP 5314A EVEN WHEN THE POWER SWITCH IS IN STBY. REMOVAL OF THE POWER CORD IS NECESSARY TO FULLY UNPOWER THE UNIT.

5-19. Make sure that only fuses with the required rated current and of the specified type (normal-blow, time-delay, etc.) are used for replacement. The use of repaired fuses and the short-circuiting of fuse-holders must be avoided. Whenever it is likely that this protection has been impaired, the HP 5314A must be made inoperative and be secured against any unintended operation.

5-20. FUSE REPLACEMENT

5-21. There are two fuses in the standard HP 5314A. These are the line input fuses located on the A2 power supply assembly. There is an additional fuse in the HP 5314A with Option 002. This fuse is located on the Option 002 A3 assembly. Instructions for changing these three fuses are given in the following paragraphs.

5-22. Line Input Fuse Replacement

CAUTION

Make sure that only fuses with the required rated current and of the fast-blow type are used for replacement. The use of repaired fuses and the short-circuiting of fuse holders must be avoided.

5-23. The following instructions are given for line fuse replacement:

1. Turn the HP 5314A OFF and remove the line input power cord.
2. Turn the HP 5314A upside down and remove the four screws near the corners of the cabinet bottom.
3. Holding the top and bottom covers together, turn the HP 5314A right-side up and carefully lift the top cover. This exposes the two line input fuses located on the A2 assembly (assembly is the rear of the instrument).
4. Remove and replace the defective fuse with a 3/8 Amp fast-blow type fuse.
5. Replace the top cover and carefully turn the unit upside down. Replace and tighten the four screws, one in each corner of the cabinet bottom.

5-24. Option 002 Fuse Replacement

5-25. HP 5314A instruments with Option 002 contain a 3 Amp fuse in addition to the two line input fuses. This fuse is located on the Option 002 A3 assembly. This fuse protects the battery pack from damage in case of a possible short-circuit. The following instructions are given for Option 002 fuse replacement:

1. Turn the HP 5314A OFF and remove the line input power cord.
2. Turn the HP 5314A upside down and remove the four screws from the cabinet bottom.
3. Holding the top and bottom covers together, turn the HP 5314A right-side up and carefully lift the top cover. This exposes the Option 002 A3 assembly.
4. Remove and replace the defective fuse with a 3 Amp fast-blow type fuse.
5. Replace the top cover and carefully turn the unit upside down. Replace and tighten the four screws, one in each corner of the cabinet bottom.

MOTHERBOARD	J3	J3

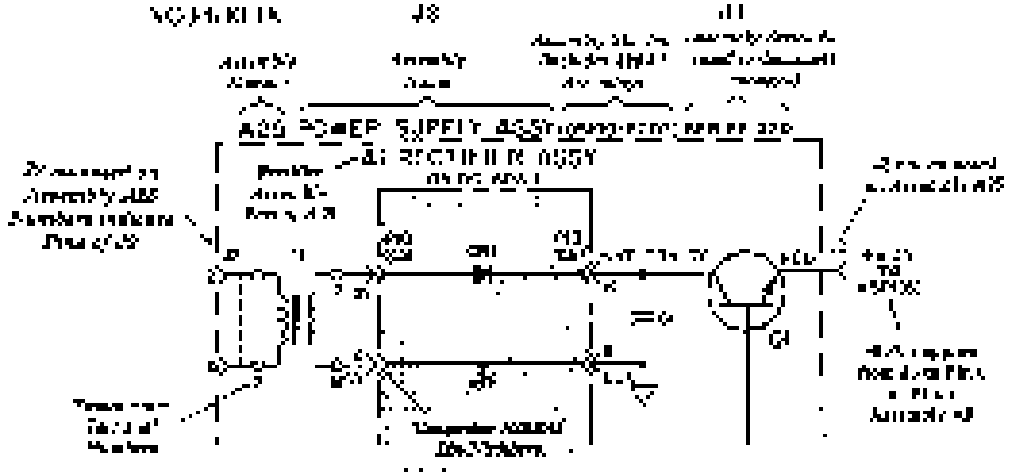

Figure 8-7. Schematic Diagram Notes

8-26. THEORY OF OPERATION

8-27. Introduction

8-28. The HP 5314A is a multifunction counter using a single LSI integrated circuit. The theory of operation is organized such that a block diagram is shown along with the block theory immediately followed by the detailed theory. The block theory is keyed to follow the block diagram. The detailed theory is referenced to the schematic diagrams found at the end of this section. There are four block diagrams, shown on figure 8-2 through 8-5, as follows:

1. The HP 5314A overall block diagram.
2. The LSI counter chip (A10).
3. The power supply.
4. The optional battery pack charger.

8-29. HP 5314A Overall Block Theory of Operation

8-30. The A and B input amplifiers condition the measured input signals and insure the subsequent digital circuits receive pulses of uniform rise time. All time. The signal on Channel B is applied directly to the counter IC. Channel A is similar to Channel B except a signal path through a ÷10 prescaler is also provided. The output of the counter drives the display through segment and digit drive lines. The digit drive lines are also used in conjunction with the front panel switches to select the proper function, range, and decimal point location. The power supply delivers +5 volts to the circuits and provides unregulated voltage to the battery charger connector for use with Option 002.

8-31. Detailed A1 Assembly Theory

8-32. INPUT AMPLIFIERS. The signal is applied through a BNC input connector (J1) through coupling capacitor C19. The compensated attenuator is made of R27, R35, and C18, and allows selection of X1 or X20 through the coaxial switch SW1C. The network made up of R22, R23, C16, and diodes CR7 and CR8 make up the overload protection circuitry. The high input impedance is accomplished by the impedance converter made up of Q7 and Q8, and their associated biasing resistors. The signal is now amplified to an acceptable level by the first two stages of U5. The first stage provides a trigger level adjustment by allowing the reference level input to be varied by approximately ±400 mV using R29. The second stage of U5 provides some peaking at high frequencies to compensate for the roll off at the input impedance converter. The final stage of U5 is a Schmitt trigger which takes the amplified analog signal and digitizes it. The signal out of the impedance converter of Channel A goes to the amplifier U5, and can be switched into Channel B by using SW1F, the SEP/COM A separate/common A switch.

8-33. Channel B is similar to Channel A with a few exceptions. A signal applied to Channel B is supplied with no attenuation through the protection circuitry made of R36, R35, C26, CR9, and CR8. The impedance converter is made up of Q9 and Q10 and their associated bias resistors. The Channel B signal is then amplified by the 3 stages of U5. The first stage provides an adjustable trigger level by setting R16. The second stage, rather than being peaked, is rolled off above 10 MHz as the Channel B is usable only to 25 MHz. The last stage is the Schmitt trigger without the high frequency compensation. The digital signal out of the Schmitt trigger must be translated to be compatible with TTL circuitry which follows. This is done by Q4 and Q3. The slope selection is done by U4C in conjunction with switch SW1E. The Channel B signal is then applied to U2.

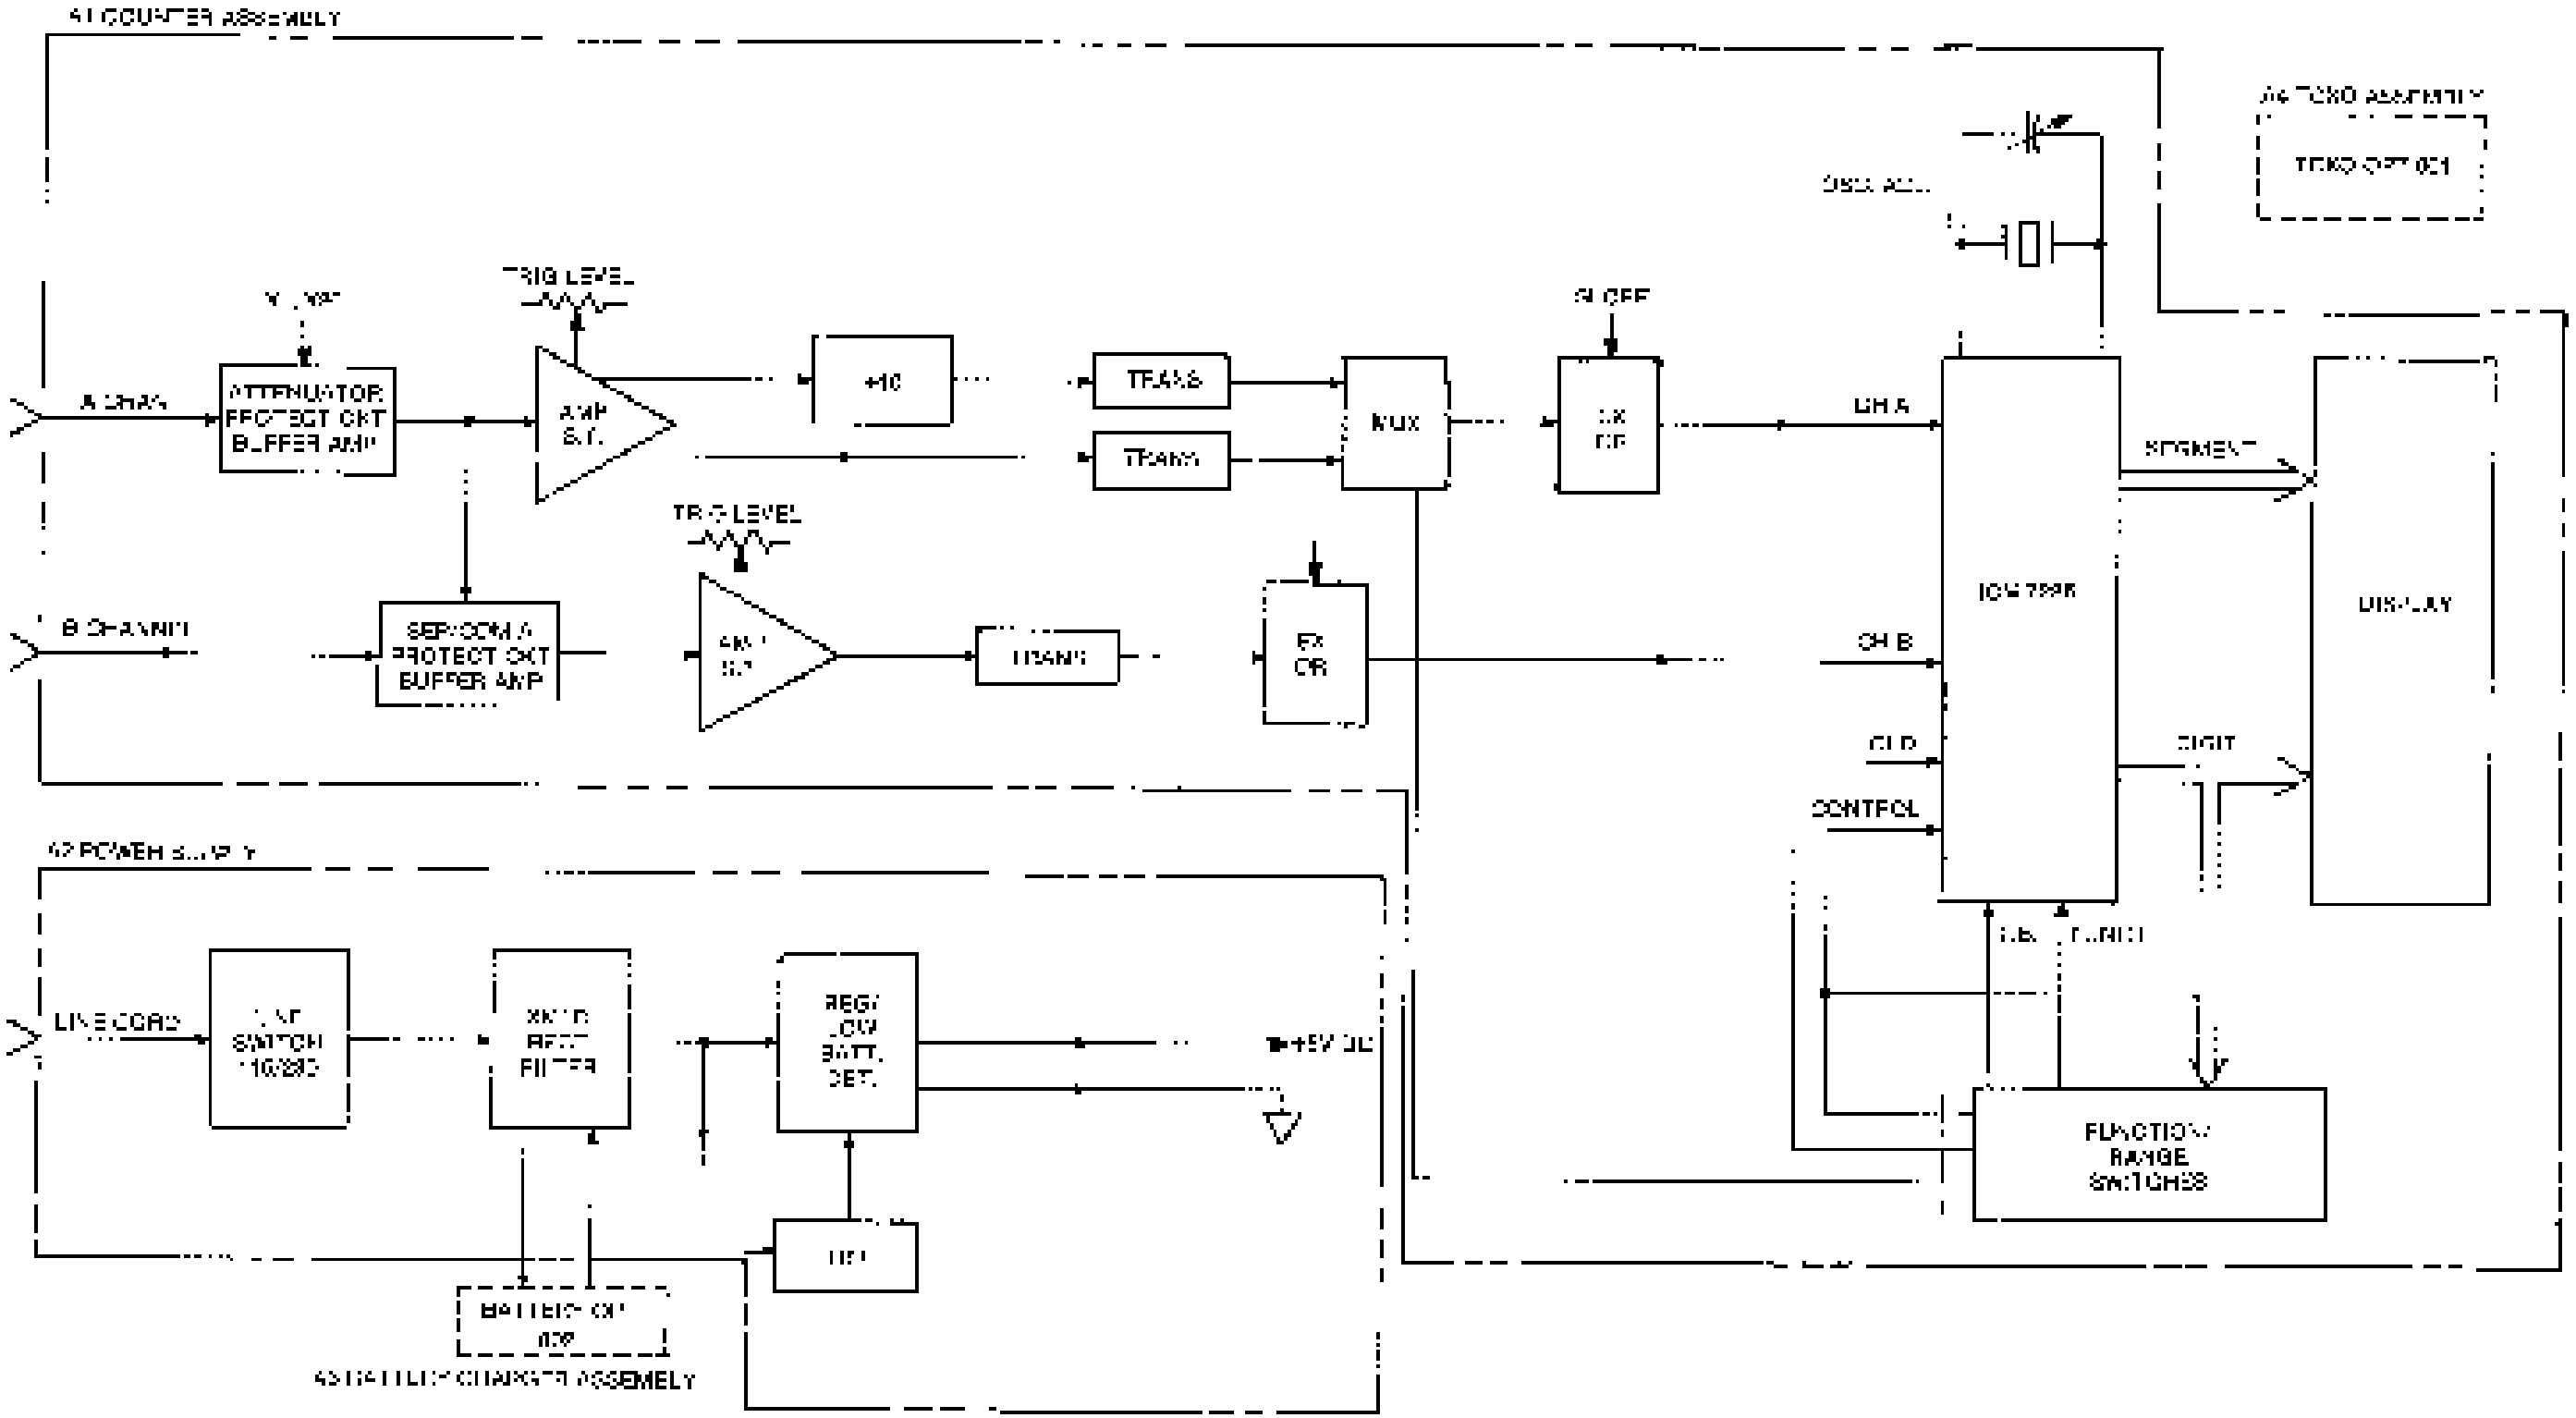

Figure 8-1. HP 5314A Overall Block Diagram

8-34. CHANNEL A PRESCALE SELECT CIRCUIT. The output of the Channel A amplifier goes to the input of U2 by taking one of two paths selected by the front panel switches. The other path is through the divide-by-ten translator Q5 and Q6. The multiplexer (U1C) selects the input or path to the slope selector circuit made up of U4 in conjunction with switch SW3. The signal is then applied to U2.

8-35. This is the normal signal path for most front panel functions. When frequency A is selected and the 100 MHz-10 Hz max frequency/resolution button is pushed, then the multiplexer (U1) checks the signal on pin 14 through the slope select logic and comes to U2. This signal has come from amplifier U5 through a ÷10 prescaler circuit and a level translator Q1 and Q2. Therefore any time the FREQ A button is pushed in conjunction with the 100 MHz-10 Hz button, the prescaler will be switched. The other sections of the U1 multiplexer provide proper location of the decimal point when in the prescale mode.

8-36. U2 COUNTER CHIP. Integrated circuit A1U2 provides the primary components of a full universal counter. The functions that can be performed are FREQUENCY, PERIOD, TIME INTERVAL, START A (DELAY), RATIO A/B and CHECK. U2 also controls the sign, strobes the data out to the display.

8-37. Function, Range, Control Inputs. In order to set the proper function and range it is necessary to connect the proper digit drive line to the function or range input of U2. Since the digit drive lines are scanned consecutively starting from the most significant digit to the least significant digit, it is always the pulse count in time which determines what function or range the instrument will operate in. As an example, connecting digit driver D3 to the function control causes U2 to be set to whatever function is selected on Channel A. Connecting the same digit driver line to the range input causes the gate time to be 0.01 seconds. A third input to U2 is used to control the various modes of operation. The operation of the function, range and control inputs are shown in Table 8-2.

8-38. Display Strobe. The display consists of seven 7-segment common anode display digits with an overflow (111) indicator. Each digit has a decimal point with the most significant digits decimal point used as a gate indicator.

8-39. In order to light a particular digit it is necessary to put the anode of the digit's character current in the appropriate cathodes to light the desired number in that digit. Therefore, it is possible to tie all the corresponding segments (cathodes) together as the anode determines which digit is being addressed. U2 first addresses the most significant digit and strobes in the proper number, then the next MSD will be addressed and the proper number strobed in and so on. A complete display strobe cycle is executed in 2 milliseconds or at a 500 Hz rate. The overflow is driven from the eighth (unused) digit.

Table 8-2. Function/Range/Control Digit Drive

Digit	Function	Range Gate Time/Mode	Control
D7	FREQUENCY	100 MHz	EXT EDGE Enable
D6	RATIO A/B	10 MHz	Channel B Select
D5	CHECK	Test	EXT Decimal Point Enable
D4	START A	Time/Edge	BLANK Display
D3	TIME INTERVAL	EXT Range Input Enable	Hold
D2	——	——	——
D1	——	——	——
D0	OVERFLOW	——	DISPLAY

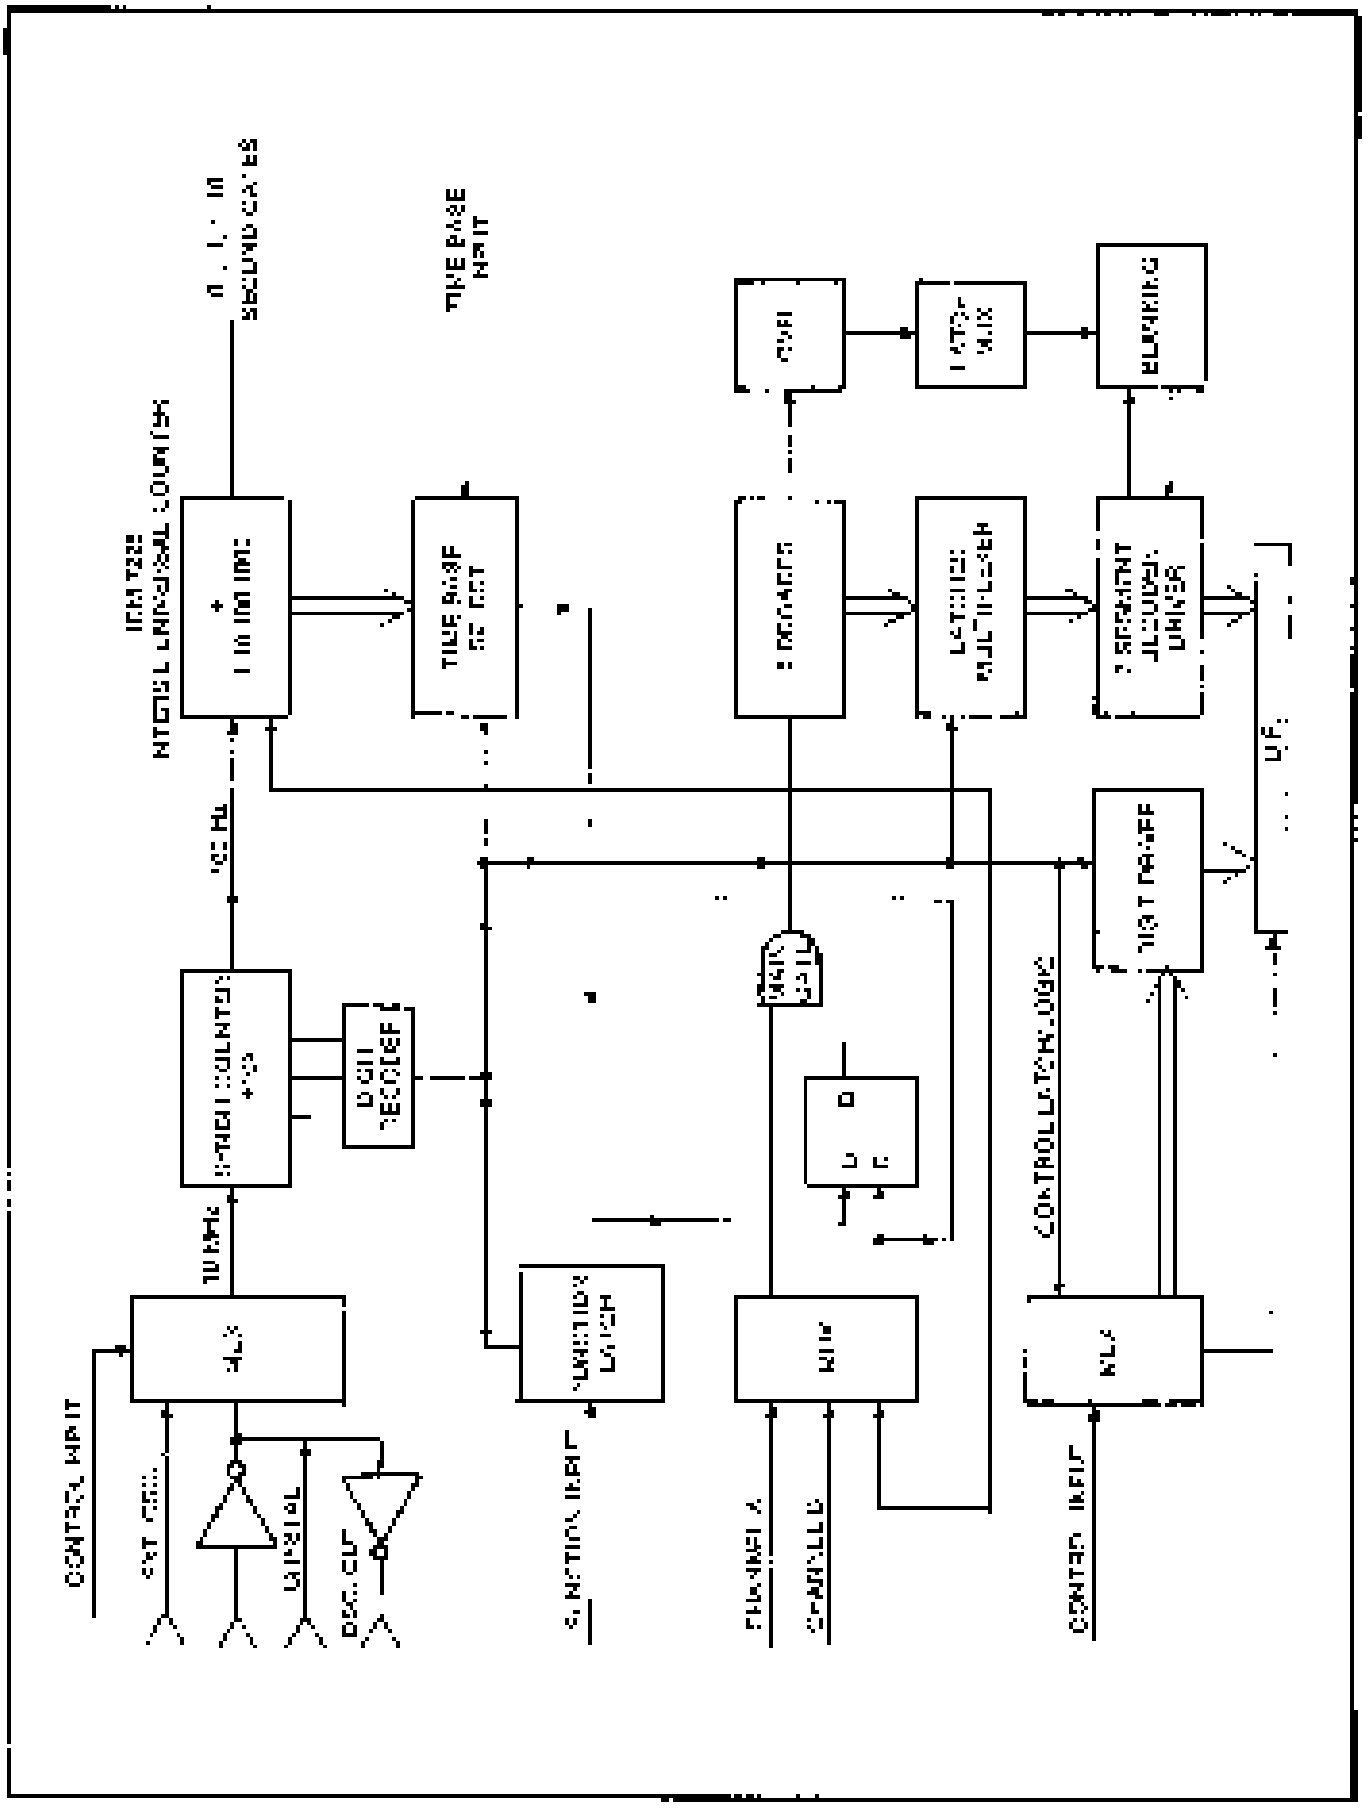

Figure 8-1. 5114A Counter (A1U2) Block Diagram

8-40. Decimal Point Control. The circuitry in U2 determines the function, range, and control status and automatically positions the decimal point. The decimal point is strobed in exactly the same manner as the segments of the digits. When the prescaler decade is overdriven, by selecting FREQ A and 100 MHz/2.0 Hz max frequency/resolution, it is necessary to move the decimal point one digit to the right. This is done by connecting digit U2 (LX1 decimal point enable) to the control input through multiplexer U1. This allows pin 38 (EXT decimal point input) to be used to strobe the decimal point from the proper position.

8-41. REFERENCE OSCILLATOR. The oscillator is made up of the 10 MHz crystal Y1 and the trimmer capacitors C2, C4, and C5, and chip resistor R6. The active elements are internal to U3. The buffered oscillator is brought out on pin 35 and is connected to the EXT OSC input on pin 33. It is therefore necessary to program the control inputs to the LX1 oscillator input mode by connecting U8 to the control input. This is done through isolation diode CR4. If the temperature compensated crystal oscillator is used, the jumper between pins 33 and 35 is removed and the TCXO output is connected between ground and pin 33 (EXT OSC input).

8-42. GATE LAMP. The gate lamp is used to give an indication that the counter is on the process of making a measurement. The gate lamp is on whenever the gate is open and the counting decades are accumulating pulses. When making measurements where the gate is only open for a short time such as time interval or single-shot period measurements, the gate signal is not on long enough to light the gate indicator. Therefore, the reset pulse is also connected to the gate indicator to provide an indication that measurements are being made. The reset pulse occurs about 140 milliseconds after the measurement is over.

8-43. POWER HOLD FUNCTION AND RESET SWITCHES. Switch SW1 connects unregulated voltage from the power supply board back to the regulator on the power supply board. Switch SW2 in the normal (NORM) position applies ground to the hold input pin 39 of U2. When SW2 is depressed, a positive voltage generated by CR3 and C14 is applied to the hold input. This terminates any measurement in progress and holds the previous reading in the display. Upon releasing the hold button, a new measurement will begin. Switches SW3, 4, and 5 connect the proper digit drive lines to the function input. Switch SW5 acts like a shift key allowing switches SW3 and SW4 to select two functions. When both SW3 and SW4 are in, not the functions CHECK or RATIO A/B are respectively selected. In this situation the shift key SW5 has no effect.

8-44. Switches SW6, 7, and 8 select the proper digit drive line to be connected to the range input. SW8 provides the special function of connecting ground to U3 (÷10 prescaler) only when SW2 is also in. The same line is also applied to the multiplexers as the control signal. Switches SW6, 7, and 8 are connected to provide more range positions than those shown on the front panel. The useful switch positions are shown below in Table 8-3.

Table 8-3. User Resolution Switch Positions (Shaded Boxes Indicate Button IN)

Switch Position			Prescale	Freq Date Time	Freq. Res.	No. of Avg.
SW6	SW7	SW8				
□	□	□	OFF	10 s	0.1 Hz	N=1000
■	□	□	OFF	1 s	1 Hz	N=100
□	■	□	ON	0.1 s	10 Hz	N=10
□	□	■	ON	1 s	10 Hz	n=1
■	□	■	ON	0.1 s	100 Hz	n=1
□	■	■	ON	2.0 ms	1 kHz	n=1

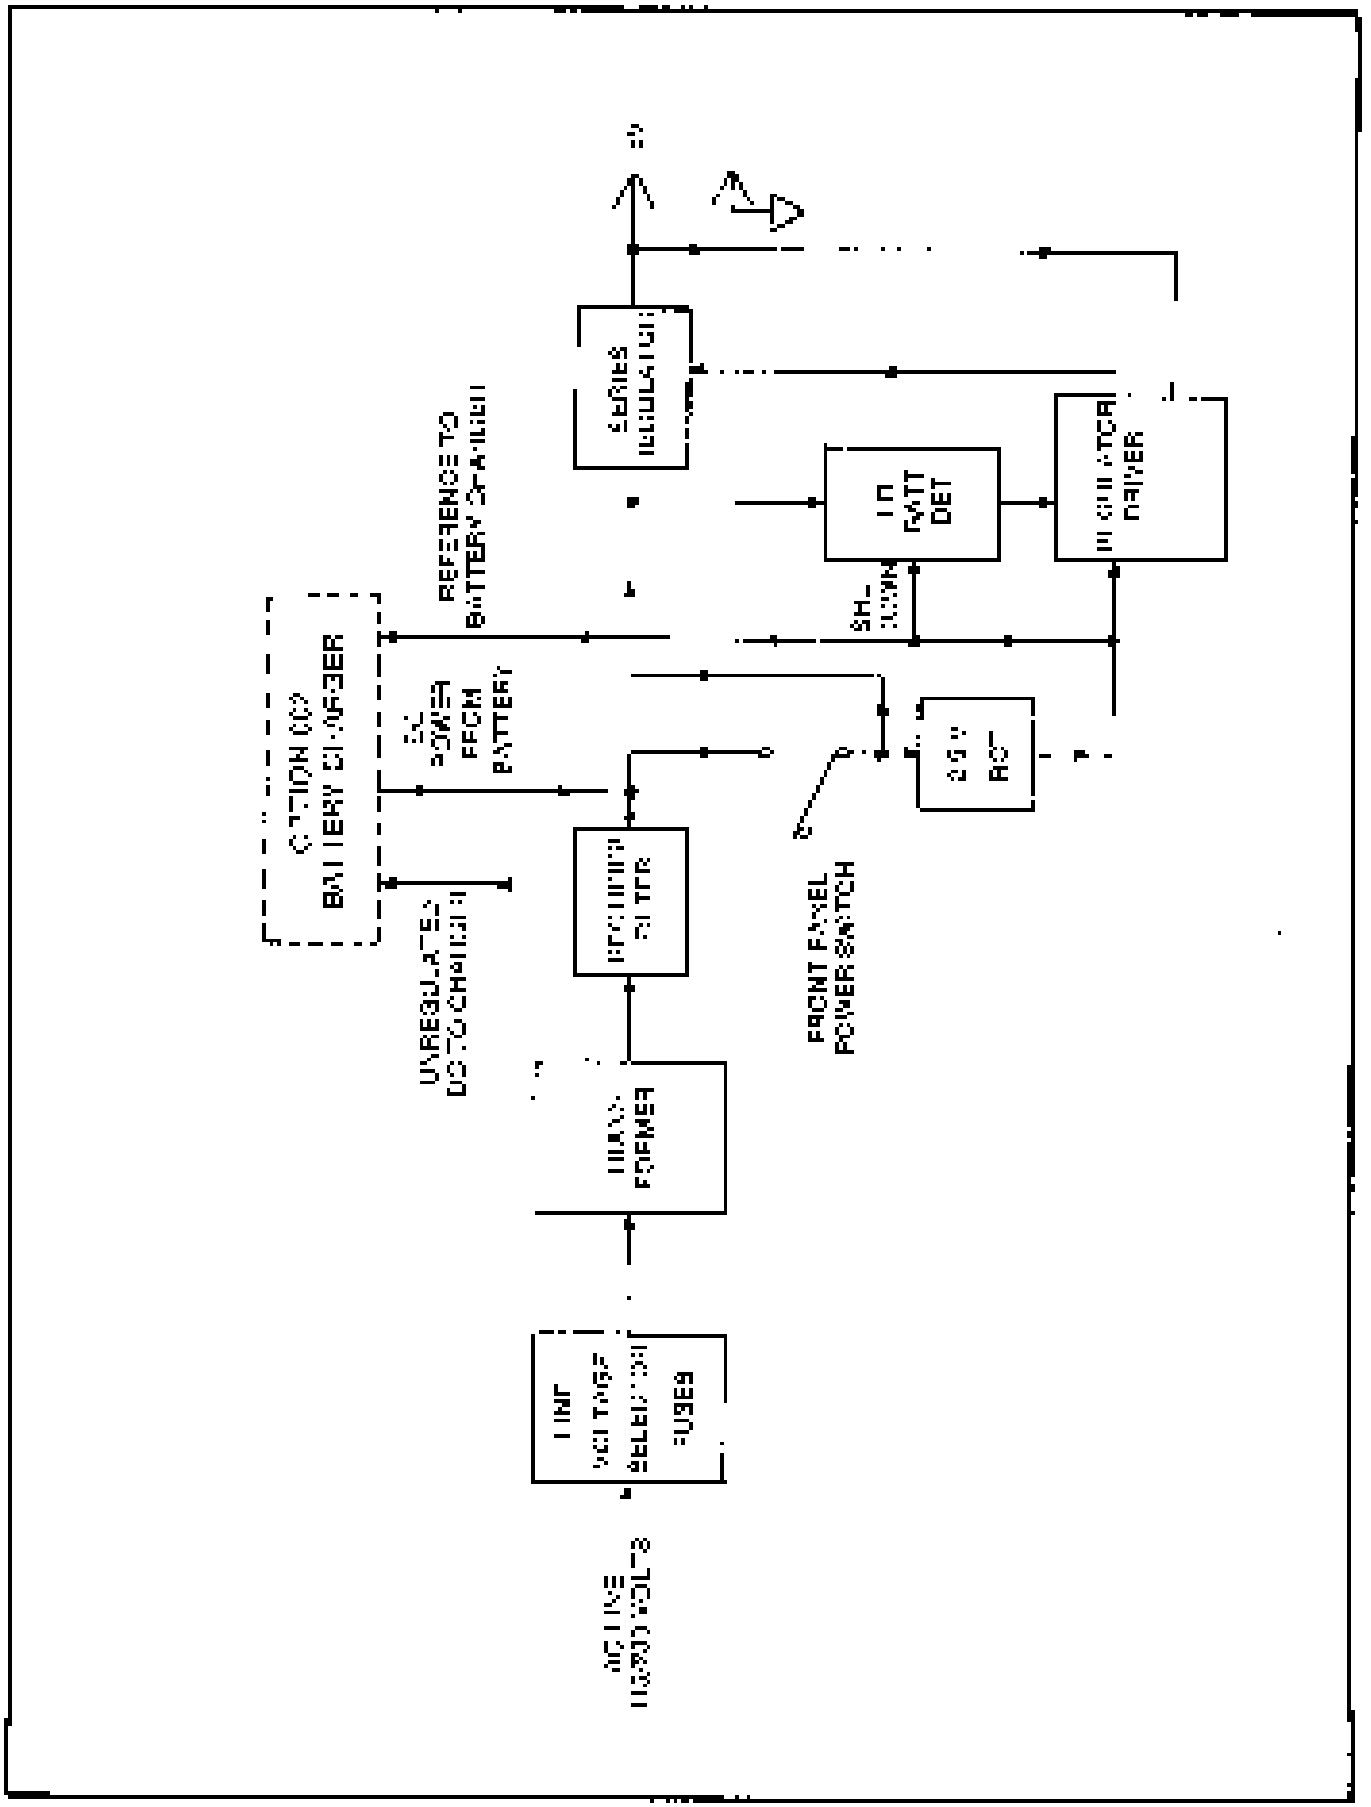

Figure 8-4. 9514A Power Supply Block Diagram

8-45. Power Supply Block Theory

8-46. The power supply contains circuitry to operate the instrument when the front panel STBY switch is pushed to ON, or charge the battery when in standby (STBY). If Option 002 is installed. Input line voltages can range from 85 to 126 volts in the 115V position of the power selector switch and 170 to 252 in the 230-volt position. The outputs provided by the power supply are regulated +5 volts at 0.5 amps, unregulated +8 to +10 volts for charging the battery and −2.5V reference to be used by the battery charger (Option 002).

8-47. Detailed A2 Assembly Theory

8-48. Line power is applied to the primary side of T1 power transformer through the line selector switch and fuses F1 and F2. The line selector switch configures the dual primary for 115-volt or 230-volt operation by connecting the windings in parallel or series, respectively. The fuses need not be changed when the line voltage selector switch is changed. The secondary of the power transformer contains a full wave rectifier and filter made up of CR2, CR1, and C1. The unregulated dc at this point is supplied to the battery charger board. The dc also passes through two isolation diodes CR5 and CR6.

8-49. These diodes keep current from flowing back out of the battery and into the charger circuitry. The dc line is broken at the point by the standby (STBY) switch located on the A1 assembly. When the switch is ON, power is supplied to the 2.5 volt regulator U1, the output regulator driver and series pass transistor, and the low voltage detector. The regulated −5 volts output is generated using a conventional series pass linear regulator. The output voltage is divided by 2 using R7 and R8. Under normal conditions this will produce 2.5 volts at the output of the divider which is applied to an operational amplifier U2 pin 2. This voltage is compared with the 2.5 volts generated by the reference U1. The output of the op amp will control the current in Q1 which controls the series pass transistor Q2. The output voltage at U2 is used as a low battery detector. When the HP 5314A is operating on battery power an attenuated version of the battery voltage is present on U2 pin 6. This voltage is compared with the 2.5 volt reference which is applied to pin 5 of U2. When the battery voltage is high, the output of U2 is low and CR4 is reverse biased. When the battery voltage gets low, indicating low capacity, pin 7 of U2 will go high. This puts pin 2 of U2 high and turns off the output transistor Q2. Positive feedback is applied around the low battery detector to provide hysteresis. This ensures that once the detector has shut the HP 5314A off, it will stay off. Capacitor C5 delays the 2.5-volt reference on pin 5 ensuring that when the instrument is turned on, it comes on then shuts down if necessary.

8-50. Option 002 Battery Charger Block Theory

8-51. The battery charger has circuitry that supplies 10 mA to the battery whenever the instrument has line power coming in. If the instrument is in the standby position, the battery is charged at a 0.5 amp rate until it is fully charged. When it is fully charged, a circuit detects this and disconnects the 0.5 amp current and resumes the 10 mA float current. See Table 8-4 for power switch operation in an HP 5314A with Option 002.

Table 8-4. Option 002 Power Switch Operation

AC Line Cord	Power Switch	Battery-Pack Operation
Connected	STBY	Recommended battery charging mode.
Connected	ON	Counter operates from ac power, charge circuitry provides a 32 mA trickle charge to battery to maintain charge level.
Disconnected	STBY	None.
Disconnected	ON	Counter operates from battery power. Auto-Shut Down circuitry operative.

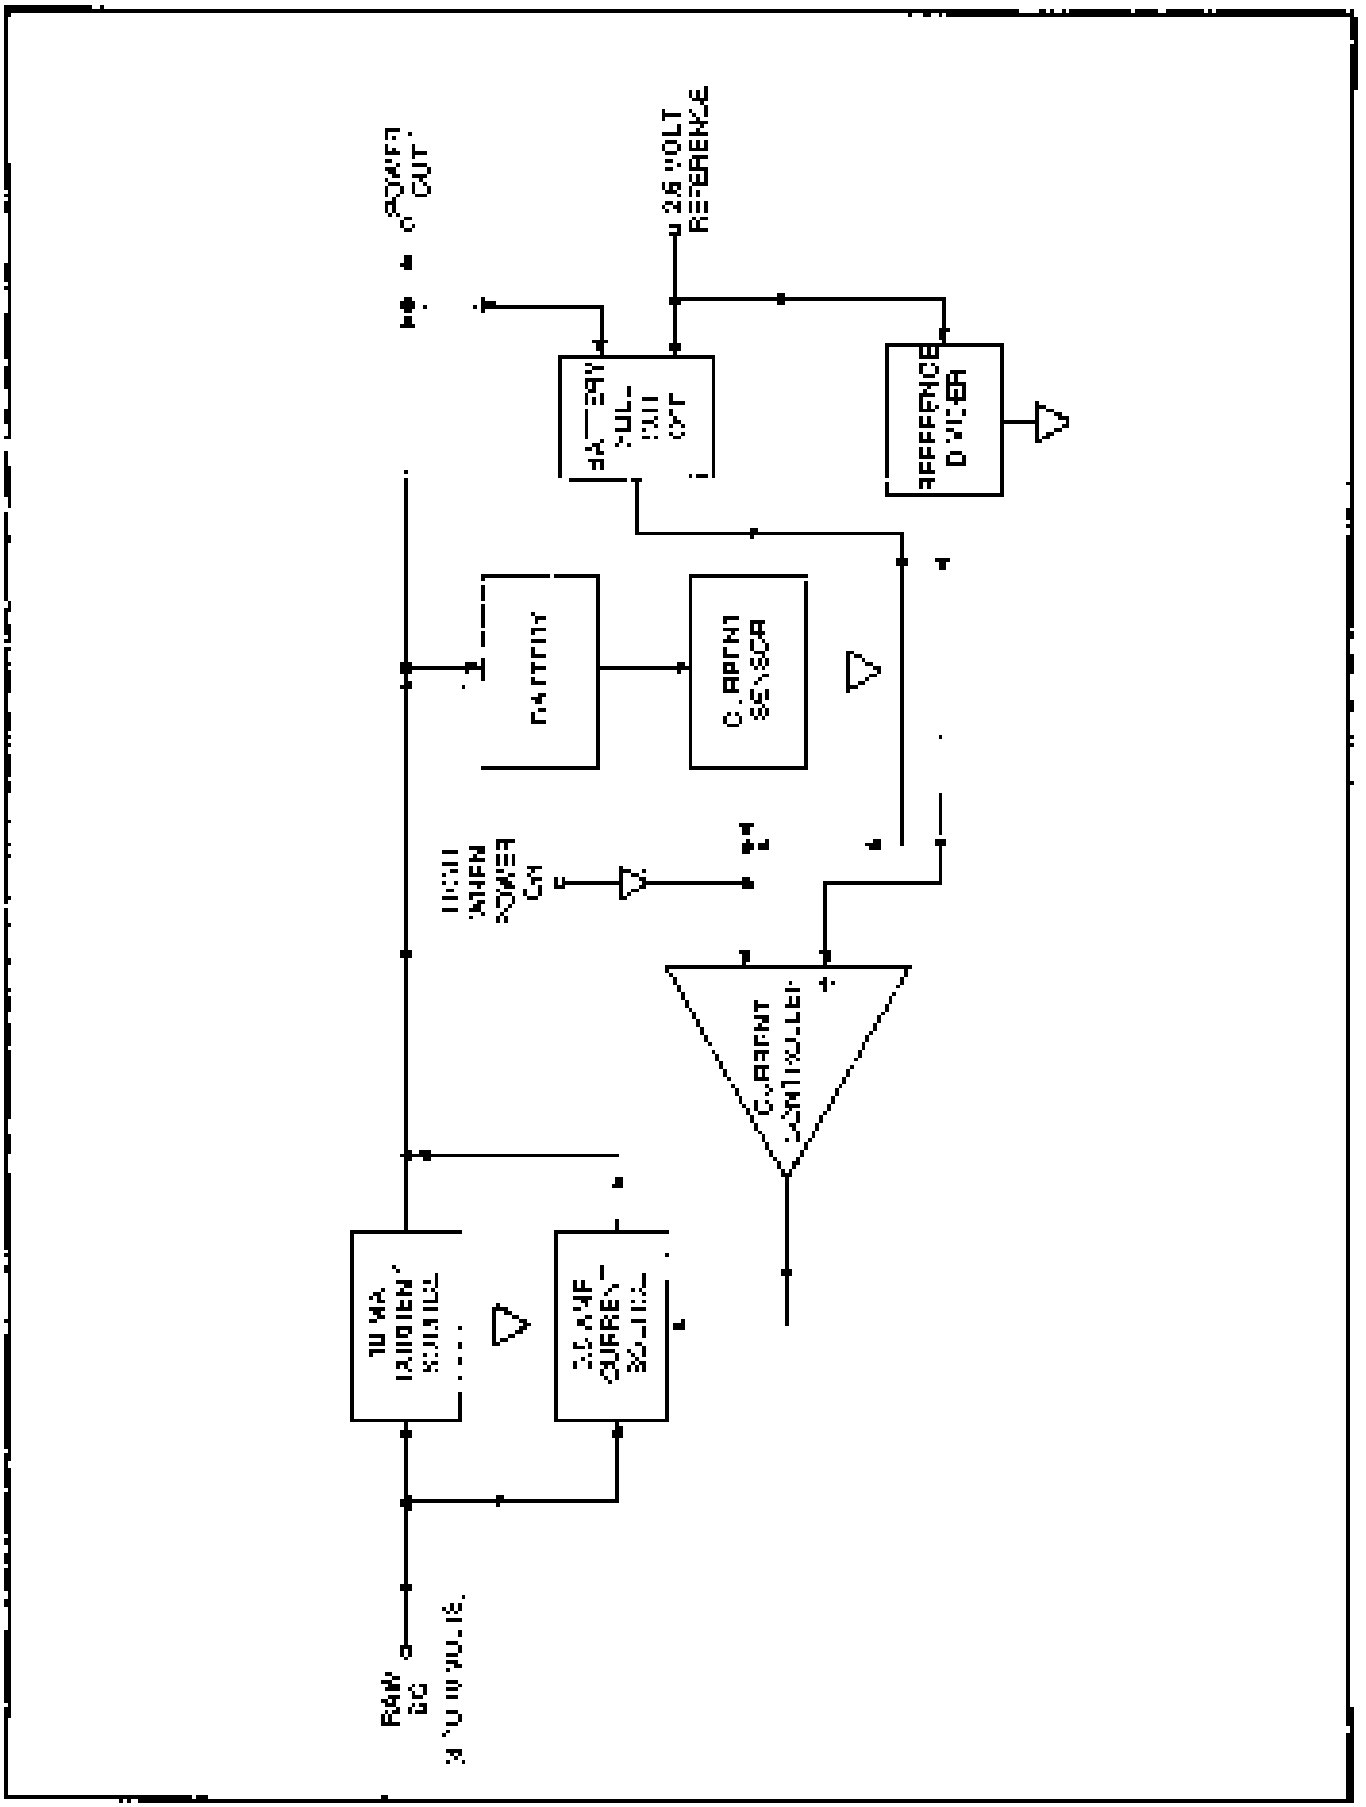

Figure 8-3. HP 5314A Optional Battery Pack Block Diagram

8-52. Detailed Option 002 A3 Assembly Theory

8-53. Power comes on to this board at pin 1. The components R1, R2, Q1, and Q2 provide continuous 10 mA to the battery from the collector of Q1. R13 is the current sensor and R4 is used to switch the current from pin 2 of the IC. The 2.5-volt reference comes on to the board at pin 5 and is divided down to 50 mV by R10 and R9. (50 mV is the voltage developed by the current sensor.) The OP amp consisting of pins 1, 2, and 3, in conjunction with Q3, Q4, R3, and R5, is used to control the 0.5 amp used to charge the battery.

8-54. CR2 is used at the battery power input connection. When the instrument is unplugged, CR1 is used so that power only leaves the board at pin 2. When the instrument is on, pin 3 goes high which disconnects the 0.5 amp current used to charge the battery. In the standard HP 3314A, the 2.5-volt reference is turned off when the switch is in STBY so power is provided through CR4 to the reference input at pin 4 needed for Option 002.

8-55. The remaining components comprise the circuit to shut off the 0.5 amp current when the battery has a full charge. R7 and R11 and the 2 kΩ potentiometer (R12) comprise the voltage divider to determine the correct voltage where the 0.5 amps should be discontinued. CR3 and the 35 KΩ thermistor are used to track the temperature changes inside the instrument. R7 pulls pin 7 to approximately 50 mV above ground when the opamp goes low. When the battery is not fully charged, pin 7 will be low because the voltage at pin 6 will be less than 2.5 volt reference at pin 5. The 2 kΩ pot is adjusted so that the full charge cutoff happens when there is 7.5 volts across the battery at room temperature. Now the thermister and CR3 are out of the circuit which causes pin 5 to go even higher. Pin 7 will not go low now until pin 6 goes below 2.5 volts. This will happen when approximately 7.5 volts is across the battery. CR5, CR4, and R8 are used to insure that the previously described circuitry has no affect on pin 2 of the IC. (Recall that pin 2 is sensing 50 mV and pin 7 goes down to 50 mV.)

8-56. TROUBLESHOOTING TEST PROCEDURES

8-57. The following test procedures are designed to effectively verify the proper operation of isolated subsections of the HP 3314A. Refer to the troubleshooting block diagram in figure 8-6 to determine the circuits tested by each procedure. Although each procedure may be performed independently, it is recommended that they be performed in the numerical sequence as given in Table 8-5.

8-58. Throughout the five troubleshooting test procedures, alphabetical test points from A to S are referenced. These test points appear on the A1 schematic diagram in Figure 8-6. They are enveloped with a black circle located at various points throughout the schematic diagram. Table 8-5 lists the test points and the signals present at each.

Table 8-5. Block Diagram Sections versus Test Procedures

Figure 8-6 Sections	Test Procedure				
	1	2	3	4	5
A	X	X	X	X	X
B		X		X	X
C			X		X
D				X	X

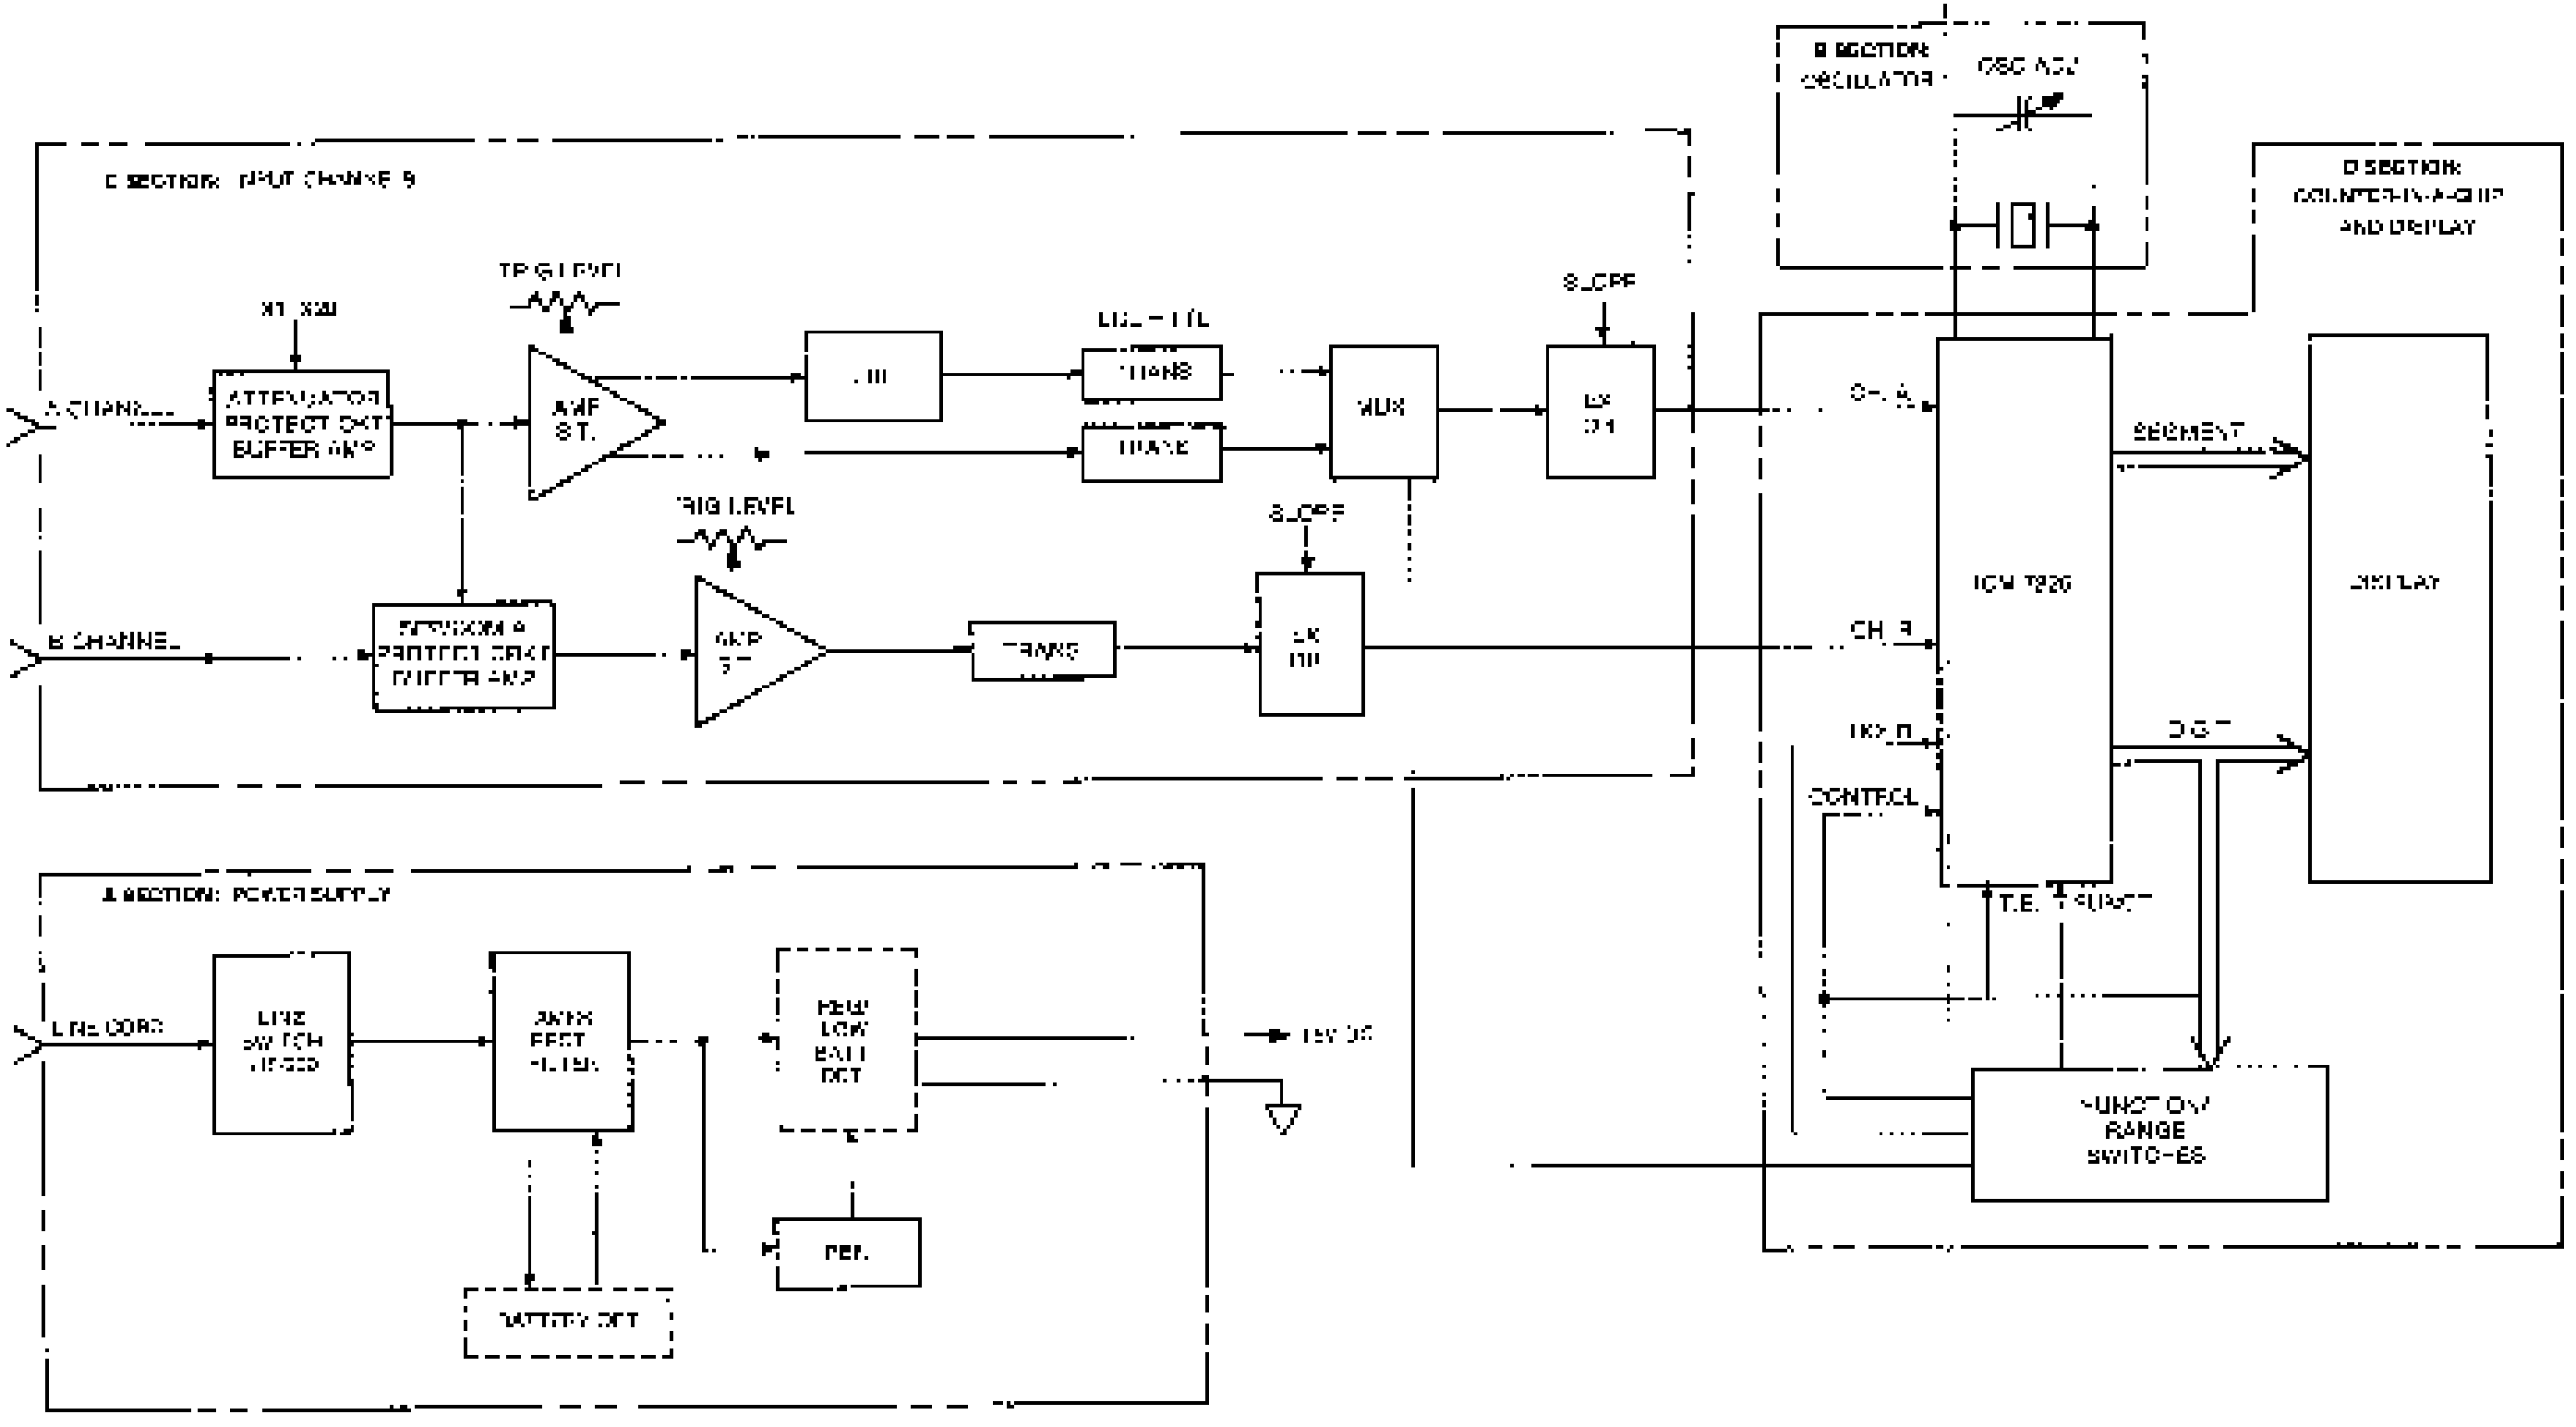

Figure 8-6. HP 5314A Troubleshooting Block Diagram

Table 8-6. A1 Test Point Specifications

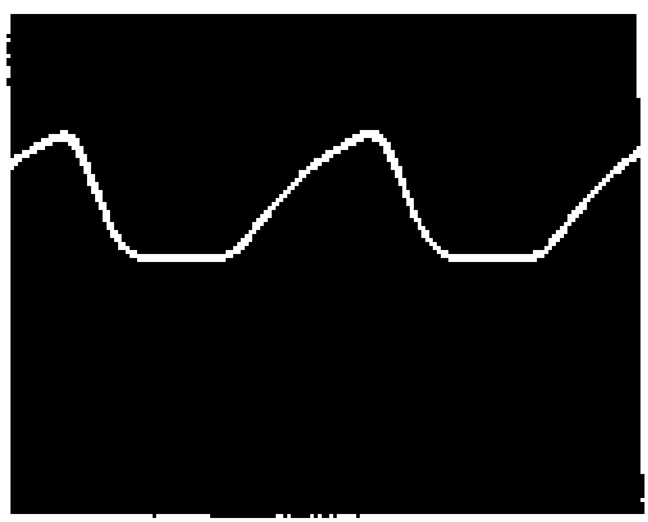
Test Point	Description
TP D:	Channel A input to wideband amplifier, collector of A1Q2
TP F&I:	Channel A Schmitt trigger outputs A1U5(13,14)
TP G:	Channel A input to Counter-Invertor chip A1U2(17)
TP H:	Channel B input to wideband amplifier—collector of A1Q5
TP J&K:	Channel B Schmitt trigger outputs A1U5(15,11)
TP L:	Channel B input to Counter-Invertor A1U2(?)
TP M:	"FUNCTION" input to A1U2(4)
TP N:	"TIME BASE" input to A1U2(2)
TP P:	"EXT OSC INPUT" A1U2(33)
TP Q:	"CONTROL" input A1U2(1)
TP R:	"COUNT" input A1U2(22)
TP S:	+5 Volts
TP T:	⏚ GND

8-59. Procedure #1: Testing of 5314A Power Supply

8-60. To verify proper operation of the HP 5314A power supply, check Test Point S on the A1 motherboard. It should be +5V ±75 mV. This is the only supply voltage in the HP 5314A, and it is not adjustable.

8-61. Procedure #2: Testing of 5314A Reference Oscillator

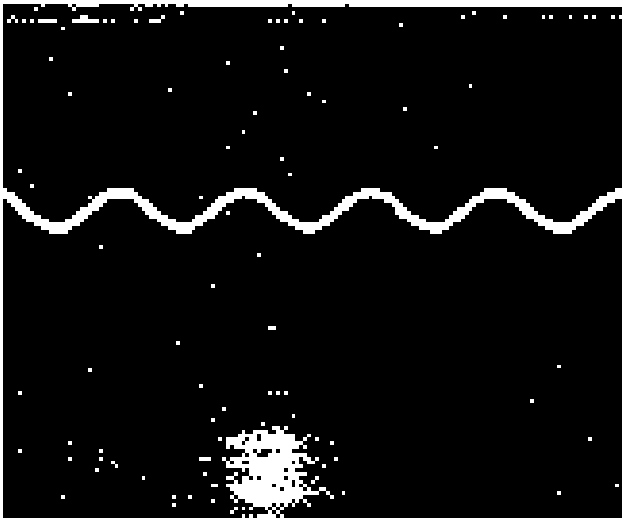
8-62. Check for the presence of the 10 MHz Reference Oscillator at Test Point P, A1U2(33); see following figure for a typical waveform.



If the 10 MHz reference oscillator is not present, check A1Y1, R6, C2, C5, and U2.

8-63. Procedure 53: Testing Input Channels

8-64. To verify proper operation of the HP 5314A input channels, apply a 10 MHz signal at 700 mV rms (~280 mV p-p) to INPUT A, then to INPUT B. Check that the proper waveform exists at TP C (A10J4[6]) and/or TP E (A10J4[8]). If they are not present, trace back the signal. The following eight photographs show the signal which should be present at the corresponding test points.



TP C: Collector of A10Q7

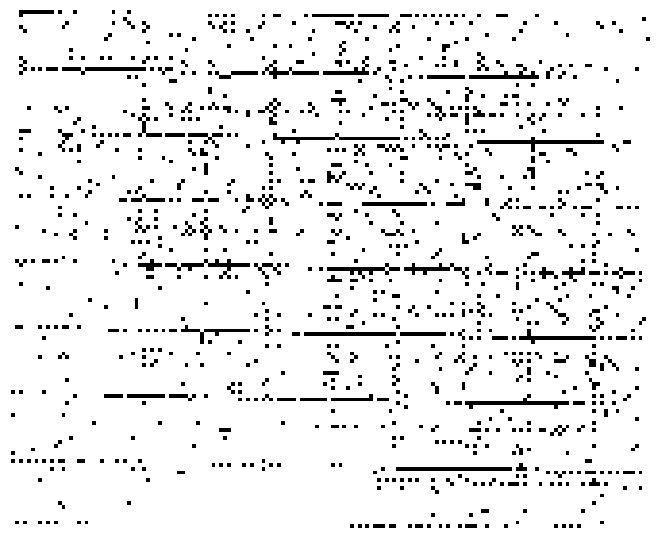
SCOPE DC
VERTICAL: 0.2V/cm
HOR: 20ns/cm

1V

TP E: A10J4[8]

SCOPE DC
VERTICAL: 1V/cm
HORIZONTAL: 50 ns/cm

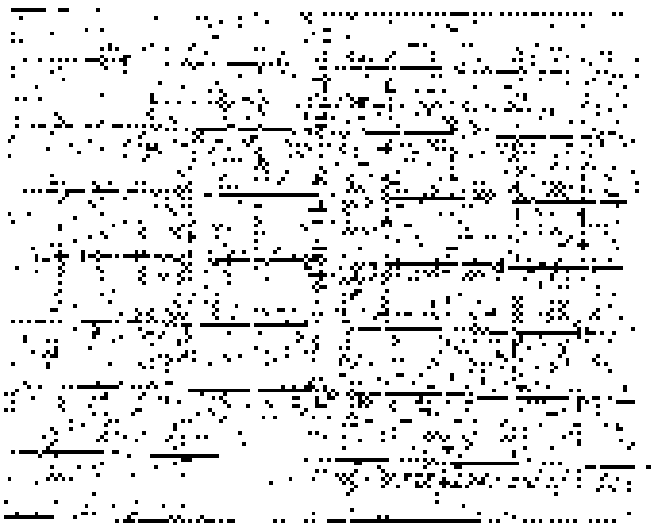
0V



TP5: A1 DEF 41

SCOPE: DC
VERTICAL: 1V/cm
HORIZONTAL: 50 ns/cm

0V



TP6: A1U49.8

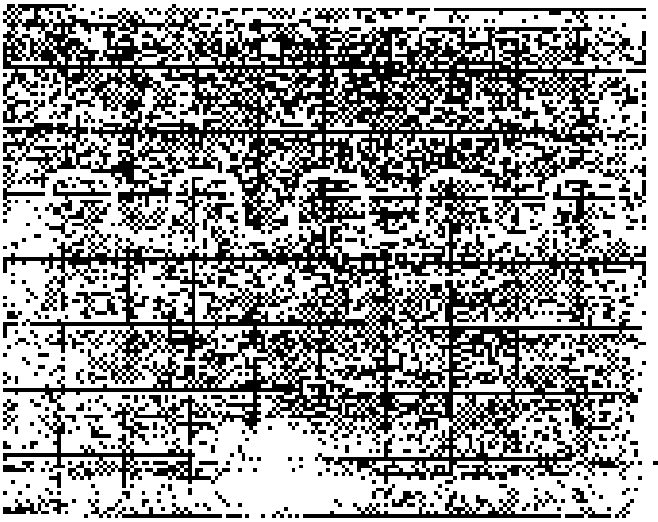
SCOPE: DC
VERTICAL: 1V/cm
HORIZONTAL: 50 ns/cm

0V

TP11: Collector of A1Q8

SCOPE: DC
VERTICAL: 0.2V/cm
HORIZONTAL: 50 ns/cm

0V



TP J: A1J6[illegible]

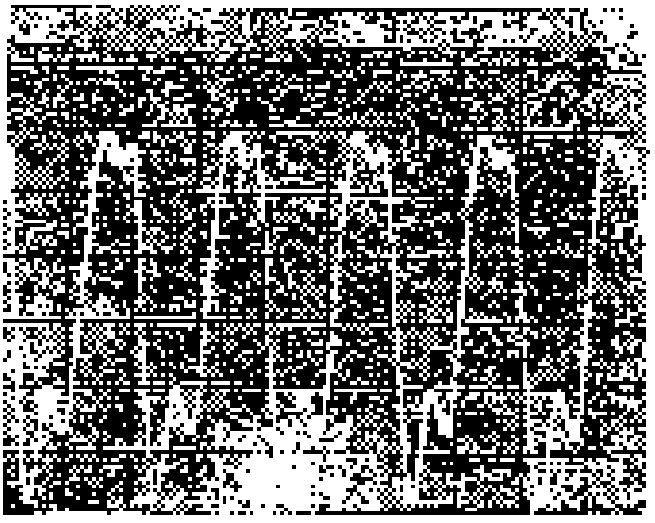
SCOPE: DC
VERTICAL: 1V/cm
HORIZONTAL: 50 ns/cm

0V

TP K: A1J8[illegible]

SCOPE: DC
VERTICAL: 1V/cm
HORIZONTAL: 50 ns/cm

0V



TP L: A1J4[illegible]

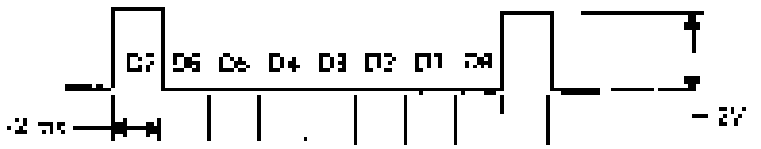
SCOPE: DC
VERTICAL: 1V/cm
HORIZONTAL: 50 ns/cm

0V

6-65. Procedure #4: Testing of ICM 7226 [Counter-in-a-Chip] and Display

6-66. To verify the proper operation of A1U2 [counter-in-a-chip] and the displays and the front panel switches, set the 5314A to SELF CHECK mode, set resolution to 10 Hz (N=1). The display should be as follows.

with "GATE" light blinking. If the counter fails to pass this test, check the DIGIT DRIVER lines from A1U3; connect A1U2(22) TP 81 to oscilloscope Channel A input. Adjust oscilloscope time base vernier so that the total period of pulses occupy 8 centimeters of the oscilloscope screen. The Digit Driver displayed is D7 on Channel A. Connect to oscilloscope Channel B Digit Drivers D6 to D0 and the corresponding pulses should coincide with the positions as illustrated in the figure below (see Table 6-7).



To verify that proper time base pulse has been selected per front panel with the counter, connect oscilloscope's Channel B to A1U1(4) or A1U2(28); (see Table 6-7).

Table 6-7. Multiplexed Digit Drive Output

Function		Digit
FUNCTION INPUT		
	FREQUENCY	D7
	PERIOD	D7
	RATIO	D7
	TIME INTERVAL	D7
	TOTALIZER	D3
	OSCILLATOR FREQUENCY	D2
RANGE INPUT (Time Base Selection)		
	100 Hz 0.01 sec CYCLES	D5
	10 Hz 0.1 sec CYCLES	D4
	1 Hz 1 sec CYCLES	D3
	0.1 Hz 10 sec CYCLES	D2
	EXTERNAL RANGE INPUT ENABLED	D1
CONTROL INPUT		
	BLANK DISPLAY	D3 HOLD
	DISPLAY TEST	D7
	1 MHz SELECT	D1
	EXTERNAL OSCILLATOR INPUT ENABLE	D6
	EXTERNAL DECIMAL POINT INPUT ENABLE	D5
	TEST	D4

6-67. Procedure #5: 20 MHz Mode

6-68. Apply a 20 MHz signal at 100 mV rms (~280 mV p-p) to the HP 5314A INPUT A with a 50-ohm feedthrough. Set the HP 5314A to FREQ A mode, with a resolution of 10 Hz (N=7), ATTN X1/X20 to X1, and LEVEL A about midrange. Verify that counter counts 20 MHz ± 1 count.
